# **1. Introduction to Purple Line**

The Maryland Transit Administration is preparing an Alternatives Analysis and Draft Environmental Impact Statement (AA/Draft EIS) to study a range of alternatives for addressing mobility and accessibility issues in the corridor between Bethesda and New Carrollton, Maryland. The corridor is located in Montgomery and Prince George's Counties, just north of the Washington, D.C. boundary. The Purple Line would provide a rapid transit connection along the 16-mile corridor that lies between the Metrorail Red Line (Bethesda and Silver Spring Stations), Green Line (College Park Station), and Orange Line (New Carrollton Station). This *Air Quality Technical Report* presents the analysis of potential air quality effects that were summarized in the AA/DEIS. It describes the methodology used for the analysis and the results of that analysis.

## **1.1. Background and Project Location**

Changing land uses in the Washington, D.C. area have resulted in more suburb-to-suburb travel, while the existing transit system is oriented toward radial travel in and out of downtown Washington, D.C. The only transit service available for east-west travel is bus service, which is slow and unreliable. A need exists for efficient, rapid, and high capacity transit for east-west travel. The Purple Line would serve transit patrons whose journey is solely east-west in the corridor, as well as those who want to access the existing north-south rapid transit services, particularly Metrorail and MARC commuter rail service.

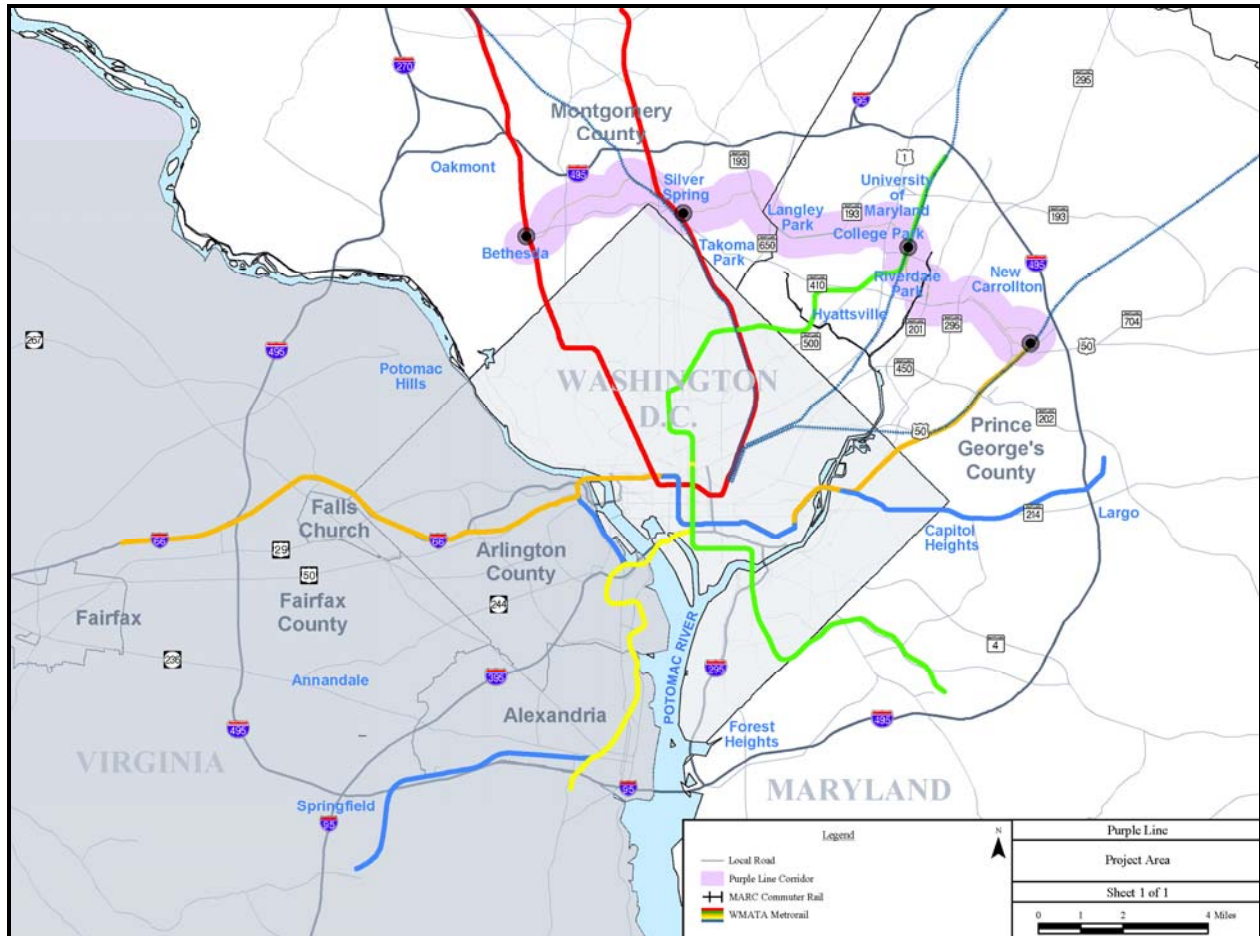

The corridor has a sizeable population that already uses transit and contains some of the busiest transit routes and transfer areas in the Washington, D.C. metropolitan area. Many communities in the corridor have a high percentage of households without a vehicle, and most transit in these communities is bus service. Projections of substantial growth in population and employment in the corridor indicate a growing need for transit improvements. The increasingly congested roadway system does not have adequate capacity to accommodate the existing average daily travel demand, and congestion on these roadways is projected to worsen as traffic continues to grow through 2030.

A need exists for high quality transit service to key activity centers and to improve transit travel time in the corridor. Although north-south rapid transit serves parts of the corridor, transit users who are not within walking distance of these services must drive or use slow and unreliable buses to access them. Faster and more reliable connections along the east-west Purple Line Corridor to the existing radial rail lines (Metrorail and MARC trains) would improve mobility and accessibility. This enhanced system connectivity would also help to improve transit efficiencies. In addition, poor air quality in the region needs to be addressed, and changes to the existing transportation infrastructure would help in attaining federal air quality standards.

### 1.1.1. Corridor Setting

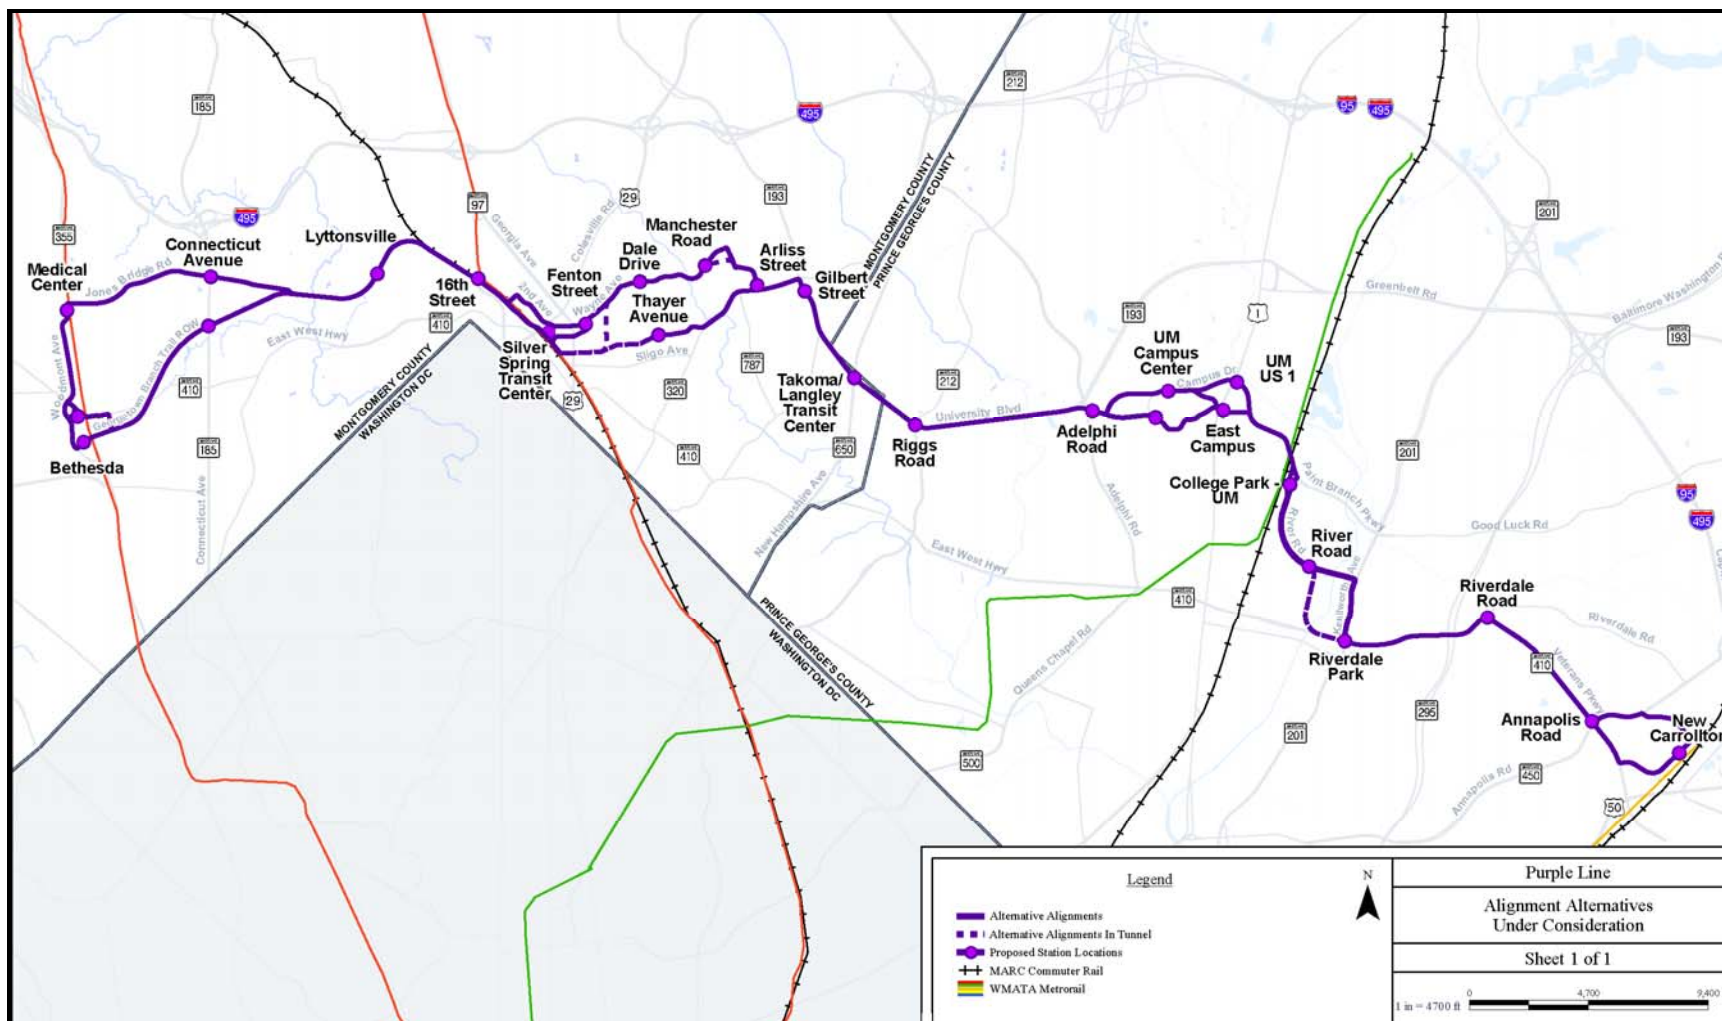

The Purple Line Corridor, as shown in Figure 1-1, is north and northeast of Washington, D.C., with a majority of the alignment within one to three miles of the circumferential I-95/I-495 Capital Beltway.

**Figure 1-1: Project Location**

## 1.2. Alternatives Retained for Detailed Study

The Purple Line study has identified eight alternatives for detailed study, shown on Figure 1-2. The alternatives include the No Build Alternative, the Transportation System Management (TSM) Alternative, and six Build Alternatives. The Build Alternatives include three using bus rapid transit (BRT) technology and three using light rail transit (LRT) technology.

**Figure 1-2: Alternative Alignments**

All alternatives extend the full length of the Purple Line Corridor between the Bethesda Metro Station in the west and the New Carrollton Metro Station in the east, with variations in alignment, type of running way (shared, dedicated, or exclusive), and amount of grade-separation options (e.g., tunnel segments or aerial). For purposes of evaluation, complete alignments need to be considered. These alternatives were used to examine the general benefits, costs, and impacts for serving major market areas within the corridor.

#### ***1.2.1. Alternative 1: No Build Alternative***

The No Build Alternative is used as the baseline against which the other alternatives are compared for purposes of environmental and community impacts. The No Build Alternative consists of the transit service levels, highway networks, traffic volumes, and forecasted demographics for horizon year 2030 that are assumed in the local Constrained Long Range Plan of the local metropolitan planning organization (in this case, the Metropolitan Washington Council of Governments).

#### ***1.2.2. Alternative 2: TSM Alternative***

The TSM Alternative provides an appropriate baseline against which all major investment alternatives are evaluated for the Federal Transit Administration's New Starts funding program. The New Starts rating and evaluation process begins when the project applies to enter preliminary engineering and continues through final design.

The TSM Alternative represents the best that can be done for mobility in the corridor without constructing a new transitway. Generally, the TSM Alternative emphasizes upgrades in transit service through operational and minor physical improvements, plus selected highway upgrades through intersection improvements, minor widening, and other focused traffic engineering actions. A TSM Alternative normally includes such features as bus route restructuring, shortened bus headways, expanded use of articulated buses, reserved bus lanes, express and limited-stop service, signalization improvements, and timed-transfer operations.

#### ***1.2.3. Build Alternatives***

The six Build Alternatives generally use the same alignments; only a few segments have locations where different roadways would be used. The differences between the alternatives are more often the incorporation of design features, such as grade separation to avoid congested roadways or intersections.

#### **Alternative 3: Low Investment BRT**

The Low Investment BRT Alternative would primarily use existing streets to avoid the cost of grade separation and extensive reconstruction of existing streets. It would incorporate signal, signage, and lane improvements in certain places. This alternative would operate mostly in mixed lanes with at-grade crossings of all intersections and queue jump lanes at some intersections. Southbound along Kenilworth Avenue and westbound along Annapolis Road, Low Investment BRT would operate in dedicated lanes. This is the only alternative that would operate on Jones Bridge Road, directly serving the National Institutes of Health and the National

Naval Medical Center near Wisconsin Avenue and Jones Bridge Road. It is also the only alternative that would use the bus portion of the new Silver Spring Transit Center. A detailed description of the alternative follows.

From the western terminus in Bethesda, Low Investment BRT would originate at the Bethesda Metro Station bus terminal. The alignment would operate on Woodmont Avenue within the existing curb. At the Bethesda Station, the buses would enter the station via Edgemoor Road and exit onto Old Georgetown Road.

At Wisconsin Avenue, just south of Jones Bridge Road, the transitway would remain on the west side of the road in exclusive lanes. Low Investment BRT would turn onto Jones Bridge Road where the transit would operate in shared lanes with queue jump lanes westbound at the intersection with Wisconsin Avenue and westbound for the intersection at Connecticut Avenue. Some widening would be required at North Chevy Chase Elementary School.

The alignment would continue along Jones Bridge Road to Jones Mill Road where it would turn right (south) onto Jones Mill Road. Eastbound on Jones Bridge Road would be a queue jump lane at the intersection. From Jones Mill Road, the alignment would turn east onto the Georgetown Branch right-of-way, where a new exclusive roadway would be constructed, with an adjacent trail on the south side.

Low Investment BRT would continue on the Georgetown Branch right-of-way, crossing Rock Creek Park on a new bridge, replacing the existing pedestrian bridge. The trail would also be accommodated on the bridge or on an adjacent bridge. A trail connection to the Rock Creek Trail would be provided east of the bridge. The alignment would continue on the Georgetown Branch right-of-way until the CSX corridor at approximately Kansas Avenue.

At this point, the alignment would turn southeast to run parallel and immediately adjacent to the CSX tracks on a new exclusive right-of-way. The trail would parallel the transitway, crossing the transitway and the CSX right-of-way east of Talbot Avenue on a new structure and continuing on the north side of the CSX right-of-way. The transitway would continue on a new roadway between the CSX tracks and Rosemary Hills Elementary School and continue past the school. The transitway would cross 16<sup>th</sup> Street at -grade, where a station would be located. The transitway would continue parallel to the CSX tracks to Spring Street where it would connect to Spring Street and turn to cross over the CSX tracks on Spring Street. The alignment would continue on Spring Street to 2<sup>nd</sup> Avenue where it would turn east. Buses would operate in shared lanes on Spring Street and Second Avenue.

Low Investment BRT would cross Colesville Road at-grade and continue up Wayne Avenue to Ramsey Street, where the buses would turn right to enter the Silver Spring Transit Center at the second level.

The buses would leave the Silver Spring Transit Center and return to Wayne Avenue via Ramsey Street. Low Investment BRT would continue east on Wayne Avenue in shared lanes. After crossing Sligo Creek Parkway, the alignment would operate in shared lanes.

At Flower Avenue, the alignment would turn left (south) onto Arliss Street, operating in shared lanes to Piney Branch Road. At Piney Branch Road, the alignment would turn left to continue in shared lanes to University Boulevard.

Low Investment BRT would follow University Boulevard to Adelphi Road. The lanes on University Boulevard would be shared. At Adelphi Road, the alignment would enter the University of Maryland (UM) campus on Campus Drive. The alignment would follow the Union Drive extension, as shown in the University of Maryland Facilities Master Plan (2001-2020), through what are currently parking lots. The alignment would follow Union Drive and then Campus Drive through campus in mixed traffic and the main gate to US 1.

Low Investment BRT would operate on Paint Branch Parkway to the College Park Metro Station in shared lanes. The alignment would then follow River Road to Kenilworth Avenue in shared lanes. Along Kenilworth Avenue, the southbound alignment would be a dedicated lane, but northbound would be in mixed traffic.

The alignment turns east from Kenilworth Avenue on East West Highway (MD 410) and continues in shared lanes on Veterans Parkway. This alignment turns left on Annapolis Road and then right on Harkins Road to the New Carrollton Metro Station. The westbound alignment on Annapolis would be dedicated, but the eastbound lanes would be shared.

#### **Alternative 4: Medium Investment BRT**

Alternative 4, the Medium Investment BRT Alternative, is, by definition, an alternative that uses the various options that provide maximum benefit relative to cost. Most of the segments are selected from either the Low or High Investment BRT Alternatives.

This alternative follows a one-way counter-clockwise loop from the Georgetown Branch right-of-way onto Pearl Street, East West Highway, Old Georgetown Road, Edgemoor Lane, and Woodmont Avenue and from there onto the Georgetown Branch right-of-way under the Air Rights Building. The buses stop at both the existing Bethesda Metro Station on Edgemoor Lane and at the new southern entrance to the Metro station under the Air Rights Building.

The alignment continues on the Georgetown Branch right-of-way with an aerial crossing over Connecticut Avenue and a crossing under Jones Mill Road.

This alignment, and all others that use the Georgetown Branch right-of-way, includes construction of a hiker-biker trail between Bethesda and the Silver Spring Transit Center.

The alignment would continue on the Georgetown Branch right-of-way until the CSX right-of-way. The alignment would cross Rock Creek Park on a new bridge, replacing the existing pedestrian bridge. The trail would also be accommodated on the bridge or on an adjacent bridge. The alignment would continue on the Georgetown Branch right-of-way until the CSX corridor at approximately Kansas Avenue. This segment of the alignment, from Jones Mill Road to the CSX corridor, would be the same for all the alternatives.

As with Low Investment BRT, this alternative would follow the CSX corridor on the south side of the right-of-way, but it would cross 16<sup>th</sup> Street and Spring Street below the grade of the streets, at approximately the same grade as the CSX tracks. The station at 16<sup>th</sup> Street would have elevators and escalators to provide access from 16<sup>th</sup> Street.

After passing under the Spring Street Bridge, Medium Investment BRT would rise above the level of the existing development south of the CSX right-of-way. East of the Falklands Chase apartments, Medium Investment BRT would cross over the CSX tracks on an aerial structure to enter the Silver Spring Transit Center parallel to, but at a higher level than, the existing tracks.

After the Silver Spring Transit Center, Medium Investment BRT would leave the CSX right-of-way and follow Bonifant Street at-grade, crossing Georgia Avenue, and just prior to Fenton Street turn north toward Wayne Avenue. The alignment would continue on Wayne Avenue in shared lanes with added left turn lanes to Flower Avenue and then Arliss Street. At Piney Branch Road, the alternative would turn left into dedicated lanes to University Boulevard.

Medium Investment BRT would be in dedicated lanes on University Boulevard with an at-grade crossing of the intersections. The alignment would continue through the University of Maryland campus in dedicated lanes on Campus Drive and then continue at-grade in a new exclusive transitway along the intramural fields to US 1.

Crossing US 1 at-grade, Medium Investment BRT would pass through the East Campus development on Rossborough Lane to Paint Branch Parkway. The alignment would continue on Paint Branch Parkway and River Road in shared lanes, as with Low Investment BRT. At Kenilworth Avenue, both lanes would be dedicated.

Turning left on East West Highway, Medium Investment BRT would be in dedicated lanes. As with Low Investment BRT, this alternative would travel in shared lanes on Veterans Parkway.

Medium Investment BRT would continue on Veterans Parkway to Ellin Road, where it would turn left into dedicated lanes to the New Carrollton Metro Station.

#### **Alternative 5: High Investment BRT via Master Plan Alignment**

The High Investment BRT Alternative is intended to provide the most rapid travel time for a BRT alternative. It would make maximum use of vertical grade separation and horizontal traffic separation. Tunnels and aerial structures are proposed at key locations to improve travel time and reduce delay. When operating within or adjacent to existing roads, this alternative would operate primarily in dedicated lanes. Like Medium Investment BRT, this alternative would serve the Bethesda Station both at the existing Bethesda bus terminal at the Metro station and at the new south entrance to the Metro station beneath the Apex Building.

High Investment BRT would follow a one-way loop in Bethesda from the Master Plan alignment onto Pearl Street, then travel west on East West Highway and Old Georgetown Road into the Bethesda Metro Station bus terminal, exit onto Woodmont Avenue southbound, and then continue left under the Air Rights Building to rejoin the Georgetown Branch right-of-way.

Elevators would provide a direct connection to the south end of the Bethesda Metro Station in the tunnel under the Air Rights Building.

High Investment BRT would be the same as Medium Investment BRT until it reaches the CSX corridor. As with the Low and Medium Investment BRT Alternatives, this alternative would follow the CSX corridor on the south side of the right-of-way, but it would cross 16<sup>th</sup> Street and Spring Street below the grade of the streets, at approximately the same grade as the CSX tracks. The station at 16<sup>th</sup> Street would have elevators and escalators to provide access from 16<sup>th</sup> Street.

The crossing of the CSX right-of-way would be the same as for Medium Investment BRT. From the Silver Spring Transit Center, High Investment BRT would continue along the CSX tracks until Silver Spring Avenue, where the alignment would turn east entering a tunnel, passing under Georgia Avenue, and turning north to Wayne Avenue. The alignment would return to the surface on Wayne Avenue near Cedar Street. It would continue on Wayne Avenue in dedicated lanes, crossing Sligo Creek Parkway, and entering a tunnel approximately half-way between Sligo Creek and Flower Avenue, then turning east to pass under Plymouth Street, crossing under Flower Avenue, and emerging from the tunnel on Arliss Street.

High Investment BRT would be the same on Piney Branch Road and University Boulevard except that the alignment would have grade-separated crossings over New Hampshire Avenue and Riggs Road.

Approaching the University of Maryland, the alignment would cross under Adelphi Road. After Adelphi Road, the alignment would follow Campus Drive and turn onto the proposed Union Drive extended. The alignment would enter a tunnel while on Union Drive, prior to Cole Field House, and pass through the campus under Campus Drive. After emerging from the tunnel east of Regents Drive, the alignment would be the same as Medium Investment BRT, until Paint Branch Parkway.

The alignment would continue east on Paint Branch Parkway in dedicated lanes, except under the CSX overpass, to the College Park Metro Station. The alternative would then follow River Road in dedicated lanes. The alignment would be dedicated on these roadways, except under the CSX Bridge on Paint Branch Parkway.

From River Road (also in dedicated lanes) near Haig Drive, the alignment would turn right and enter a tunnel heading south, roughly parallel to Kenilworth Avenue. Near East West Highway (MD 410), the alignment would turn left and continue in the tunnel under Anacostia River Park. The alignment would transition to a surface alignment west of the Kenilworth Avenue/East West Highway intersection. The alternative would follow East West Highway in dedicated lanes.

High Investment BRT would turn right down Veterans Parkway in dedicated lanes. Unlike Medium Investment BRT, this alignment would cross under Annapolis Road before continuing on to Ellin Road.

### **Alternative 6: Low Investment LRT**

The Low Investment LRT Alternative would operate in shared and dedicated lanes with minimal use of vertical grade separation and horizontal traffic separation. All LRT Alternatives would serve only the south entrance of the Bethesda Station and would operate there in a stub-end platform arrangement.

Low Investment LRT would begin on the Georgetown Branch right-of-way near the Bethesda Metro Station under the Air Rights Building. The hiker-biker trail connection to the Capital Crescent Trail would not be through the tunnel under the Air Rights Building, but rather through Elm Street Park on existing streets. The terminal station would be the Bethesda Metro Station with a connection to the southern end of the existing station platform.

After emerging from under the Air Rights Building, the transitway would follow the Georgetown Branch right-of-way, crossing Connecticut Avenue at-grade and crossing under Jones Mill Road. Between approximately Pearl Street and just west of Jones Mill Road, the trail would be on the north side of the transitway; elsewhere it would be on the south side.

The segment from Jones Mill Road to Spring Street in the CSX corridor would be the same as for Low and Medium Investment BRT.

After crossing Spring Street, Low Investment LRT would be the same as the Medium and High Investment BRT Alternatives.

Low Investment LRT would be the same as Medium Investment BRT from the Silver Spring Transit Center to Bonifant Street to Wayne Avenue.

Turning right, Low Investment LRT would continue at-grade on Wayne Avenue in shared lanes, crossing Sligo Creek Parkway and entering a tunnel from Wayne Avenue to pass under Plymouth Street. As with High Investment BRT, the alignment emerges from the tunnel on Arliss Street.

The Low Investment LRT Alternative would then follow Piney Branch Road and University Boulevard at-grade in dedicated lanes. In keeping with the low investment definition of this alternative, the major intersections of New Hampshire Avenue and Riggs Road would not be grade-separated.

As this alternative approaches Adelphi Road, the grade of the existing roadway is too steep for the type of LRT vehicles being considered. For this reason, the transitway would cross the intersection below grade.

At Adelphi Road, the alignment would enter the University of Maryland campus on Campus Drive. The alignment would follow the same alignment to the College Park Metro Station as described for Medium Investment BRT.

From the College Park Metro Station to the terminus at the New Carrollton Metro Station, Low Investment LRT would be in dedicated lanes on River Road. On Kenilworth Avenue, the LRT would be in a dedicated lane southbound, but a shared lane northbound. On East West Highway, the LRT would be in dedicated lanes with shared left turn lanes and in shared lanes under Baltimore-Washington Parkway. On Veterans Parkway, the LRT is in dedicated lanes.

As with Low Investment BRT, this alignment turns left on Annapolis Road from Veterans Parkway and then right on Harkins Road to the New Carrollton Metro Station. The segments on Annapolis Road and Harkins Lane would be dedicated.

#### **Alternative 7: Medium Investment LRT**

Medium Investment LRT is the same as Low Investment LRT from Bethesda to the CSX corridor, except that the alignment would cross over Connecticut Avenue.

Along the CSX corridor, the alignment would be the same as High Investment BRT, grade-separated (below) at 16<sup>th</sup> and Spring Streets. The alignment would be the same as Medium and High Investment BRT and Low Investment LRT from Spring Street through the Silver Spring Transit Center.

From the Silver Spring Transit Center, the alignment would follow Bonifant Street in dedicated lanes to Wayne Avenue. On Wayne Avenue, this alternative would be in shared lanes with added left turn lanes. The alignment would be the same as Low Investment LRT until Paint Branch Parkway, where it would be in dedicated lanes, except under the CSX/metro tracks at the College Park Metro Station, except for Paint Branch Parkway where it would be in dedicated lanes. The LRT follows River Road, Kenilworth Avenue, East West Highway, and Veterans Parkway in dedicated lanes. At the intersection of Veterans Parkway and Annapolis Road the LRT continues across Annapolis, turning left at Ellin Road still in dedicated lanes.

#### **Alternative 8: High Investment LRT**

Alternative 8, High Investment LRT, would be the same as the High Investment BRT Alternative, except for the Bethesda terminus. The alignment would begin just west of the tunnel under the Air Rights Building. The hiker-biker trail would follow the alignment through the tunnel under the Air Rights Building. Because of physical constraints, the trail would be elevated above the westbound tracks. The trail would return to grade as it approaches Woodmont Avenue. The terminal station would be the Bethesda Metro Station with a connection to the southern end of the existing station platform.

#### **1.2.4. Design Options**

##### **North Side of CSX**

This design option is based on the Georgetown Branch Master Plan. From the eastern end of the Georgetown Branch right-of-way, the alignment would cross under the CSX corridor and then continue down the north side. It would emerge from the tunnel near Lyttonsville Road in Woodside. The alignment would be below the grade of 16<sup>th</sup> Street, passing under the bridge, but providing a station at that location. It would also pass under the Spring Street Bridge but would

begin to rise on an aerial structure over the CSX right-of-way 1,000 feet northwest of Colesville Road due to the location of the Metro Plaza Building. The aerial structure over the CSX right-of-way would provide the required 23-foot clearance from top of rail to bottom of structure. The alternative would enter the Silver Spring Transit Center parallel to, but at a higher level than, the existing tracks.

#### **South Side of CSX with a Crossing West of the Falklands Chase Apartments**

This option would operate on the south side of the CSX, as described either at or below grade at 16<sup>th</sup> Street. The alignment would cross the CSX corridor between Spring Street and Fenwick Lane. This option would continue along the north side of the CSX right-of-way on an aerial structure over the CSX right-of-way 1,000 feet northwest of Colesville Road, due to the location of the Metro Plaza Building. The aerial structure over the CSX right-of-way would provide the required 23-foot clearance from top of rail to bottom of structure. The alternative would enter the Silver Spring Transit Center parallel to, but at a higher level than, the existing tracks.

#### **Silver Spring/Thayer Tunnel**

This design option would begin at the Silver Spring Transit Center where the alignment leaves the CSX corridor near Silver Spring Avenue. It would enter a tunnel on Silver Spring Avenue passing under Georgia Avenue and Fenton Street. At approximately Grove Street, the alignment would shift northward to continue under the storm drain easement and backyards of homes on Thayer and Silver Spring Avenues. The transitway would emerge from the tunnel behind the East Silver Spring Elementary School on Thayer Avenue and follow Thayer Avenue across Dale Drive to Piney Branch Road. If the mode selected were LRT, the grade of Piney Branch Road would require an aerial structure from west of Sligo Creek and Sligo Creek Parkway and would return to grade just west of Flower Avenue. This aerial structure requires that the road be widened. For this design option, a station would be located on Thayer Avenue where the alignment would emerge from the tunnel.

#### **University of Maryland Campus via Preinkert Drive**

Preinkert Drive is being evaluated as a design option for both BRT and LRT through the campus of the University of Maryland. The alignment would run from the west on Campus Drive turning right onto Preinkert Drive where it would head southeast. The transitway would turn left to pass directly between LeFrak Hall and the South Dining Campus Hall and then northeast through the Lot Y parking lot. From there, the alignment would run east along Chapel Drive between Memorial Chapel and Marie Mount Hall and eventually would pass to the south of Lee Building at Chapel Fields. The alignment would continue onto Rossborough Lane, passing directly north of Rossborough Inn to cross US 1, and continues east through the East Campus development.

#### ***1.2.5. Stations and Station Facilities***

Between 20 and 21 stations are being considered for each of the alternatives. Table 1-1 provides the stations for each of the Build Alternatives.

**Table 1-1: Stations by Alternative**

Segment Name	Low Invest. BRT	Medium Invest. BRT	High Invest. BRT	Low Invest. LRT	Medium Invest. LRT	High Invest. LRT
Bethesda Metro, North Entrance	Yes	Yes	Yes	N/A	N/A	N/A
Medical Center Metro	Yes	N/A	N/A	N/A	N/A	N/A
Bethesda Metro, South Entrance	N/A	Yes	Yes	Yes	Yes	Yes
Connecticut Avenue	Yes	Yes	Yes	Yes	Yes	Yes
Lyttonsville	Yes	Yes	Yes	Yes	Yes	Yes
Woodside/16 <sup>th</sup> Street	Yes	Yes	Yes	Yes	Yes	Yes
Silver Spring Transit Center	Yes	Yes	Yes	Yes	Yes	Yes
Fenton Street	Yes	Yes	N/A	Yes	Yes	N/A
Dale Drive	Yes	Yes	Yes	Yes	Yes	Yes
Manchester Place	Yes	Yes	Yes	Yes	Yes	Yes
Arliss Street	Yes	Yes	Yes	Yes	Yes	Yes
Gilbert Street	Yes	Yes	Yes	Yes	Yes	Yes
Takoma/Langley Transit Center	Yes	Yes	Yes	Yes	Yes	Yes
Riggs Road	Yes	Yes	Yes	Yes	Yes	Yes
Adelphi Road	Yes	Yes	Yes	Yes	Yes	Yes
University of Maryland Campus Center	Yes	Yes	Yes	Yes	Yes	Yes
US 1	Yes	N/A	N/A	N/A	N/A	N/A
East Campus	N/A	Yes	Yes	Yes	Yes	Yes
College Park Metro	Yes	Yes	Yes	Yes	Yes	Yes
River Road	Yes	Yes	Yes	Yes	Yes	Yes
Riverdale Park	Yes	Yes	Yes	Yes	Yes	Yes
Riverdale Heights	Yes	Yes	Yes	Yes	Yes	Yes
Annapolis Road	Yes	Yes	Yes	Yes	Yes	Yes
New Carrollton Metro	Yes	Yes	Yes	Yes	Yes	Yes

The design of the Purple Line stations has not been determined at this stage of the project; however, the stations would likely include the following elements: shelters, ticket vending machines, seating, and electronic schedule information. The stations would be located along the transitway and would be on local sidewalks or in the median of the streets, depending on the location of the transitway. Because both the BRT and LRT vehicles under consideration are “low floor,” the platforms would be about 14 inches above the height of the roadway. The platforms would be approximately 200 feet long and between 10 and 15 feet wide, depending on the anticipated level of ridership at each particular station. No new parking facilities would be constructed as part of the Purple Line. Municipal parking garages exist near the Bethesda and Silver Spring Metro Stations, and transit parking facilities exist at the College Park and New Carrollton Metro Stations.

Additional kiss-and-ride facilities would be considered at the stations at Connecticut Avenue on the Georgetown Branch right-of-way and Lyttonsville. The Silver Spring Transit Center, College Park Metro Station, and New Carrollton Metro Station already have kiss-and-ride parking facilities available and the Purple Line would not add more. It has been determined that kiss-and-ride facilities are not needed at the Takoma/Langley Transit Center.

### ***1.2.6. Maintenance and Storage Facilities***

LRT and BRT both require maintenance and storage facilities; however, the requirements in terms of location and size are not the same. LRT requires a facility located along the right-of-way while a BRT facility can be located elsewhere. Depending on the construction phasing and mode chosen, two maintenance facilities (one in Montgomery County and one in Prince George's County) are ideal.

The size of the facility depends on the number of vehicles required. A fleet of 40 to 45 vehicles (including Spares) would require approximately 20 acres. The Purple Line would also require storage for non-revenue vehicles and equipment such as: maintenance, supervisory, and security vehicles.

Activities at the maintenance facility would include:

- Vehicle Storage area (tracks for LRT)
- Inspection/Cleaning
- Running Repairs
- Maintenance/Repair
- Operations/Security
- Parking
- Materials/Equipment Storage

Two sites improve operations by providing services and storage near the ends of the alignment. It is possible to have one site provide the majority of the services and the other function as an auxiliary site.

Five potential sites were identified during the course of the alternatives analysis and were evaluated for environmental impacts. As part of the screening process three were eliminated from further consideration. These five sites are listed below:

- Lyttonsville – This is a maintenance facility on Brookville Road in Lyttonsville, currently used by Montgomery County Ride On buses and school buses. The Purple Line would require the use of some additional adjacent property.
- Haig Court – This site is located on River Road at Haig Court. It would require minimal grading, but is partly wooded, and is very close to the residential neighborhood of Riverdale which is also a historic district.
- North Veterans Parkway – This site is located on the north side of Veterans Parkway. This site is heavily wooded and includes steep grades.
- Glenridge Maintenance Facility – This site is located on the south side of Veterans Parkway near West Lanham Shopping Center. It is currently being used as a maintenance facility for Prince George's County Park vehicles.

- MTA New Carrollton property – This site is a parcel owned but the MTA on the east side of the New Carrollton Metro station. It is not particularly well located for use by the Purple Line because it would require the Purple Line to pass under or around the New Carrollton Metro Station.

The Lyttonsville site and the Glenridge Maintenance Facility were identified as the two sites most appropriate for maintenance and storage facilities for the project based on potential environmental effects and location. These two sites would provide sufficient capacity for either BRT or LRT operations; and are well located near either end of the alignment.

#### ***1.2.7. Traction Power Substations***

Light rail's electric traction power system requires electrical substations approximately every 1.25 miles, depending on the frequency and size of the vehicles. These substations, which are approximately 10 feet by 40 feet, do not need to be immediately adjacent to the tracks. This flexibility means the substations can be located to minimize visual intrusions and can be visually shielded by fencing, landscaping, or walls, or can be incorporated into existing buildings. The number and location of these substations will be determined during the preliminary engineering phase of project development.

## **2. Environmental Analysis**

### **2.1. Affected Environment**

Air pollution is a general term that refers to one or more chemical substances that degrade the quality of the atmosphere. Individual air pollutants degrade the atmosphere by reducing visibility, damaging property, reducing the productivity or vigor of crops or natural vegetation, or harming human or animal health.

#### ***2.1.1. Clean Air Act Amendments of 1990***

The Clean Air Act (CAA) Amendments of 1990 and the Final Transportation Conformity Rule [40 CFR Parts 51 and 93] direct the U.S. Environmental Protection Agency (EPA) to implement environmental policies and regulations that will ensure acceptable levels of air quality.

The CAA and the Final Transportation Conformity Rule affect proposed transportation projects. According to Title I, Section 176 (c) 2:

"No federal agency may approve, accept, or fund any transportation plan, program, or project unless such plan, program, or project has been found to conform to any applicable State Implementation Plan (SIP) in effect under this act."

The Final Conformity Rule defines conformity as follows:

"Conformity to an implementation plan's purpose of eliminating or reducing the severity and number of violations of the National Ambient Air Quality Standards (NAAQS) and achieving expeditious attainment of such standards; and

That such activities will not:

- Cause or contribute to any new violation of any NAAQS in any area;
- Increase the frequency or severity of any existing violation of any NAAQS in any area; or
- Delay timely attainment of any NAAQS or any required interim emission reductions or other milestones in any area."

#### ***2.1.2. National and State Ambient Air Quality Standards***

As required by the CAA, NAAQS have been established for six major air pollutants. These pollutants, known as criteria pollutants, are carbon monoxide, nitrogen dioxide, ozone, particulate matter, sulfur dioxide, and lead.

The federal standards are summarized in Table 2-1. The primary standards have been established to protect the public health. The secondary standards are intended to protect the nation's welfare, and they account for air pollutant effects on soil, water, visibility, materials, vegetation, and other aspects of the general welfare.

**Table 2-1: National Ambient Air Quality Standards**

Pollutant	Averaging Period	National and State Standards	
		Primary	Secondary
Carbon Monoxide (CO)	Eight Hours <sup>1</sup>	9 ppm (10 µg/m <sup>3</sup> )	No Secondary Standard
	One Hour <sup>1</sup>	35 ppm (40 µg/m <sup>3</sup> )	No Secondary Standard
Lead (Pb)	Maximum Quarterly Average	1.5 µg/m <sup>3</sup>	Same as Primary Standard
Nitrogen Dioxide (NO <sub>2</sub> )	Annual Arithmetic Mean	0.053 ppm (100 µg/m <sup>3</sup> )	Same as Primary Standard
Particulate Matter (PM <sub>10</sub> )	Annual Arithmetic Mean <sup>2</sup>	50 µg/m <sup>3</sup> / Revoked <sup>2</sup>	
	24-Hour <sup>3</sup>	150 µg/m <sup>3</sup>	
Fine Particulate Matter (PM <sub>2.5</sub> )	Annual Arithmetic Mean <sup>4</sup>	15 µg/m <sup>3</sup>	Same as Primary Standard
	98 <sup>th</sup> Percentile 24-Hour <sup>5</sup>	65 µg/m <sup>3</sup> / 35 µg/m <sup>3</sup>	Same as Primary Standard
Ozone (O <sub>3</sub> )	Fourth Highest Eight-Hour Daily Maximum <sup>6</sup>	0.08 ppm	Same as Primary Standard
	Maximum Daily One-hour Average <sup>7</sup> (applies only in limited areas)	0.12 ppm (235 µg/m <sup>3</sup> )	Same as Primary Standard
Sulfur Dioxide (SO <sub>2</sub> )	Annual Arithmetic Mean	80 µg/m <sup>3</sup> (0.03 ppm)	–
	24 Hours <sup>1</sup>	365 µg/m <sup>3</sup> (0.14 ppm)	–
	Three Hours <sup>1</sup>	–	1,300 ug/m <sup>3</sup> / (0.5 ppm)

Source: EPA, National Primary and Secondary Ambient Air Quality Standards (49 CFR 50), October 2006.

**Notes:**

<sup>1</sup> Not to be exceeded more than once per year.

<sup>2</sup> Due to a lack of evidence linking health problems to long-term exposure to coarse particle pollution, the agency revoked the annual PM<sub>10</sub> standard in 2006 (effective December 17, 2006).

<sup>3</sup> Not to be exceeded more than once per year on average over three years.

<sup>4</sup> To attain this standard, the three-year average of the weighted annual mean PM<sub>2.5</sub> concentrations from single or multiple community-oriented monitors must not exceed 15.0 µg/m<sup>3</sup>.

<sup>5</sup> To attain this standard, the three-year average of the 98<sup>th</sup> percentile of 24-hour concentrations at each population-oriented monitor within an area must not exceed 35 µg/m<sup>3</sup> (effective December 17, 2006).

<sup>6</sup> To attain this standard, the three-year average of the fourth-highest daily maximum eight-hour average ozone concentrations measured at each monitor within an area over each year must not exceed 0.08 ppm.

<sup>7</sup> (a) The standard is attained when the expected number of days per calendar year with maximum hourly average concentrations above 0.12 ppm is ≤1, as determined by Appendix H of 40 CFR 50 – National Primary and Secondary Ambient Air Quality Standards  
[http://ecfr.gpoaccess.gov/cgi/t/text/text-idx?c=ecfr&tpl=/ecfrbrowse/Title40/40cfr50\\_main\\_02.tpl](http://ecfr.gpoaccess.gov/cgi/t/text/text-idx?c=ecfr&tpl=/ecfrbrowse/Title40/40cfr50_main_02.tpl).

(b) As of June 15, 2005, EPA revoked the one-hour ozone standard in all areas except the 14 eight-hour ozone nonattainment Early Action Compact Areas. The project is not located in one of these areas.

Abbreviations: ppm = parts per million, µg/m<sup>3</sup> = micrograms per cubic meter.

### **2.1.3. Criteria Pollutants and Effects**

Pollutants that have established national standards are referred to as criteria pollutants. The sources of these pollutants, their effects on human health and the nation's welfare, and their final deposition in the atmosphere vary considerably. A brief description of each pollutant is provided below.

**Ozone.** Ozone ( $O_3$ ) is a colorless toxic gas. As shown in Figure 2-1,  $O_3$  is found in both the earth's upper and lower atmospheric levels. In the upper atmosphere,  $O_3$  is a naturally occurring gas that helps to prevent the sun's harmful ultraviolet rays from reaching the earth. In the lower layer of the atmosphere,  $O_3$  is man-made. Although  $O_3$  is not directly emitted, it forms in the lower atmosphere through a chemical reaction between hydrocarbons (HC), also referred to as volatile organic compounds or VOCs, and nitrogen oxides ( $NO_x$ ), which are emitted from industrial sources and automobiles. Substantial  $O_3$  formations generally require a stable atmosphere with strong sunlight; thus high levels of  $O_3$  are generally a concern in the summer.  $O_3$  is the main ingredient of smog.  $O_3$  enters the bloodstream through the respiratory system and interferes with the transfer of oxygen, depriving sensitive tissues in the heart and brain of oxygen.  $O_3$  also damages vegetation by inhibiting its growth.

**Particulate Matter.** Particulate pollution is composed of solid particles or liquid droplets that are small enough to remain suspended in the air. In general, particulate pollution can include dust, soot, and smoke; these can be irritating but are not usually poisonous.

Particulate pollution also can include bits of solid or liquid substances that can be highly toxic. Of particular concern are those particles that are smaller than, or equal to, 10 microns ( $PM_{10}$ ) and 2.5 microns ( $PM_{2.5}$ ) in size.

$PM_{10}$  refers to particulate matter less than 10 microns in diameter, about  $1/7^{th}$  the thickness of a human hair (Figure 2-2). Particulate matter pollution consists of very small liquid and solid particles floating in the air, which can include smoke, soot, dust, salts, acids, and metals. Particulate matter also forms when industry and gases emitted from motor vehicles undergo chemical reactions in the atmosphere.

Major sources of  $PM_{10}$  include motor vehicles; wood-burning stoves and fireplaces; dust from construction, landfills, and agriculture; wildfires and brush/waste burning; industrial sources; windblown dust from open lands; and atmospheric chemical and photochemical reactions. Suspended particulates produce haze and reduce visibility.

Data collected through numerous nationwide studies indicate that most of the  $PM_{10}$  comes from the following:

- Fugitive dust
- Wind erosion
- Agricultural and forestry sources

Source: OzoneNY [http://www.ozoneny.org/about\\_ozone/good\\_vs\\_bad\\_ozone.asp](http://www.ozoneny.org/about_ozone/good_vs_bad_ozone.asp)

**Figure 2-1: Ozone in the Atmosphere**

Source: EPA Office of Air and Radiation <http://www.epa.gov/oar/particlepollution/basic.html>

**Figure 2-2: Relative Particulate Matter Size**

A small portion of particulate matter is the product of fuel combustion processes. In the case of  $PM_{2.5}$ , the combustion of fossil fuels accounts for a significant portion of this pollutant. The main health effect of airborne particulate matter is on the respiratory system.  $PM_{2.5}$  refers to particulates that are 2.5 microns or less in diameter, roughly  $1/28^{th}$  the diameter of a human hair.  $PM_{2.5}$  results from fuel combustion (from motor vehicles, power generation, and industrial facilities), residential fireplaces, and wood stoves. In addition,  $PM_{2.5}$  can be formed in the atmosphere from gases such as sulfur dioxide, nitrogen oxides, and VOCs. Like  $PM_{10}$ ,  $PM_{2.5}$  can penetrate the human respiratory system's natural defenses and damage the respiratory tract when inhaled. Whereas particles 2.5 to 10 microns in diameter tend to collect in the upper portion of the respiratory system, particles 2.5 microns or less are so tiny that they can penetrate deeper into the lungs and damage lung tissues.

**Carbon Monoxide.** Carbon monoxide (CO) is a colorless gas that interferes with the transfer of oxygen to the brain. CO is emitted almost exclusively from the incomplete combustion of fossil fuels. As shown in Figure 2-3, on-road motor vehicle exhaust is the primary source of CO. In cities, 85 to 95 percent of all CO emissions may come from motor vehicle exhaust. Prolonged exposure to high levels of CO can cause headaches, drowsiness, loss of equilibrium, or heart disease. CO levels are generally highest in the colder months of the year when inversion conditions (when warmer air traps colder air near the ground) are more frequent.

CO concentrations can vary greatly over relatively short distances. Relatively high concentrations of CO are typically found near congested intersections, along heavily used roadways carrying slow-moving traffic, and in areas where atmospheric dispersion is inhibited by urban "street canyon" conditions. Consequently, CO concentrations must be predicted on a localized, or microscale, basis.

**Nitrogen Dioxide.** Nitrogen dioxide ( $NO_2$ ) is a brownish gas that irritates the lungs. It can cause breathing difficulties at high concentrations. As with  $O_3$ ,  $NO_2$  is not directly emitted, but is formed through a reaction between nitric oxide (NO) and atmospheric oxygen. NO and  $NO_2$  are collectively referred to as nitrogen oxides ( $NO_x$ ) and are major contributors to ozone formation.  $NO_2$  also contributes to the formation of  $PM_{10}$ . At atmospheric concentrations,  $NO_2$  is only potentially irritating. In high concentrations, the result is a brownish-red cast to the atmosphere and reduced visibility. There is some indication of a relationship between  $NO_2$  and chronic pulmonary fibrosis. An increase in bronchitis in children (two and three years old) has also been observed at concentrations below 0.3 ppm.

**Lead.** Lead (Pb) is a stable element that persists and accumulates both in the environment and in animals. Its principal effects in humans are on the blood-forming, nervous, and renal systems. Lead levels in the urban environment from mobile sources have decreased significantly due to the federally-mandated switch to lead-free gasoline.

**Sulfur Dioxide.** Sulfur Dioxide ( $SO_2$ ) is a product of high-sulfur fuel combustion. The main sources of  $SO_2$  are coal and oil used in power stations, industry, and domestic heating. Industrial chemical manufacturing is another source of  $SO_2$ .  $SO_2$  is an irritant gas that attacks the throat and lungs. It can cause acute respiratory symptoms and diminished ventilator function in children.  $SO_2$  can also yellow plant leaves and corrode iron and steel.

Source: US EPA, <http://www.epa.gov/air/urbanair/co/what1.html#>

**Figure 2-3: Sources of CO**

#### **2.1.4. Mobile Source Air Toxics**

In addition to the criteria pollutants for which there are NAAQS, EPA also regulates air toxics. Toxic air pollutants are those pollutants known or suspected to cause cancer or other serious health effects. Most air toxics originate from human-made sources, including on-road mobile sources, non-road mobile sources (e.g., airplanes), area sources (e.g., dry cleaners), and stationary sources (e.g., factories or refineries). The CAA identified 188 air toxics. In 2001 EPA identified a list of 21 Mobile Source Air Toxics (MSAT) and highlighted six of these MSATs as priority MSATs. Since 2001, EPA has conducted an extensive review of the literature to produce a list of the compounds identified in the exhaust or evaporative emissions from on-road and non-road equipment and alternative fuels. This list currently includes approximately 1,000 compounds, many emitted in trace amounts.

In February 2007, EPA finalized a rule to reduce hazardous air pollutants from mobile sources (*Control of Hazardous Air Pollutants from Mobile Sources*, February 9, 2007). The rule limits the benzene content of gasoline and reduces toxic emissions from passenger vehicles and gas cans. EPA estimates that in 2030 this rule would reduce total emissions of MSATs by 330,000 tons and VOC emissions (precursors to ozone and PM<sub>2.5</sub>) by more than one million tons.

By 2010, EPA's existing programs will reduce MSATs by more than one million tons from 1999 levels. In addition to controlling pollutants, such as hydrocarbons, particulate matter, and nitrogen oxides, EPA's recent regulations controlling emissions from highway vehicles and non-road equipment will result in large air toxic reductions. Furthermore, EPA has programs under development that would provide additional benefits from further controls for small non-road gasoline engines and diesel locomotive and marine engines. Finally, EPA has developed a variety of programs to reduce risk in communities, such as Clean School Bus USA, the Voluntary Diesel Retrofit Program, Best Workplaces for Commuters, and National Clean Diesel Campaign.

#### **2.1.5. Greenhouse Gases**

Gases that trap heat in the atmosphere are often referred to as greenhouse gases. Greenhouse gases are necessary to life as we know it because they keep the planet's surface warmer than it otherwise would be. This is referred to as the Greenhouse Effect (Figure 2-4). As concentrations of greenhouse gases are increasing, however, the earth's temperature is increasing. According to National Oceanic and Atmospheric Administration and National Aeronautics and Space Administration data, the earth's average surface temperature has increased by about 1.2 to 1.4°F in the last 100 years. Eleven of the last 12 years rank among the 12 warmest years on record (since 1850), with the warmest two years being 1998 and 2005. Most of the warming in recent decades is very likely the result of human activities. Other aspects of the climate are also changing, such as rainfall patterns, snow and ice cover, and sea level.

Source: <http://www.epa.gov/climatechange/science/index.html>

**Figure 2-4: The Greenhouse Effect**

Some greenhouse gases, such as carbon dioxide, occur naturally and are emitted to the atmosphere through natural processes and human activities. Other greenhouse gases (e.g., fluorinated gases) are created and emitted solely through human activities. The principal greenhouse gases that enter the atmosphere because of human activities are described below.

**Carbon Dioxide (CO<sub>2</sub>).** Carbon dioxide enters the atmosphere through the burning of fossil fuels (oil, natural gas, and coal), solid waste, trees and wood products, and also as a result of other chemical reactions (e.g., manufacture of cement). Carbon dioxide is also removed from the atmosphere (or sequestered) when it is absorbed by plants as part of the biological carbon cycle.

**Methane (CH<sub>4</sub>).** Methane is emitted during the production and transport of coal, natural gas, and oil. Methane emissions also result from livestock and other agricultural practices and by the decay of organic waste in municipal solid waste landfills.

**Nitrous Oxide (N<sub>2</sub>O).** Nitrous oxide is emitted during agricultural and industrial activities and during combustion of fossil fuels and solid waste.

**Fluorinated Gases.** Hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride are synthetic, powerful greenhouse gases that are emitted from a variety of industrial processes. Fluorinated gases are sometimes used as substitutes for ozone-depleting substances (e.g., chlorofluorocarbons, hydrochlorofluorocarbons, and halons). These gases are typically emitted in smaller quantities, but because they are potent greenhouse gases, they are sometimes referred to as High Global Warming Potential gases (High GWP gases).

Greenhouse gases differ in their ability to trap heat. For example, one ton of emissions of CO<sub>2</sub> has a different effect than one ton of emissions of methane. To compare emissions of different greenhouse gases, inventory compilers use a weighting factor called a Global Warming Potential or GWP. To use a GWP, the heat-trapping ability of one metric ton (1,000 kilograms) of CO<sub>2</sub> is taken as the standard, and emissions are expressed in terms of CO<sub>2</sub> equivalent, but can also be expressed in terms of carbon equivalent. For mobile source analyses based on fossil fuel consumption, CO<sub>2</sub> is the predominant greenhouse gas emitted; therefore, this analysis will focus on CO<sub>2</sub> emission burdens generated by the project's energy consumption.

#### ***2.1.6. Attainment Status/Regional Air Quality Conformity***

Section 107 of the 1977 CAA Amendment requires that EPA publish a list of all geographic areas in compliance with the NAAQS and areas not in attainment of the NAAQS. The designation of an area is made on a pollutant-by-pollutant basis. EPA's area designations are shown in Table 2-2.

**Table 2-2: Attainment Classifications and Definitions**

<b>Attainment</b>	<b>Unclassified</b>	<b>Maintenance</b>	<b>Nonattainment</b>
Area is in compliance with the NAAQS.	Area has insufficient data to make a determination and is treated as being in attainment.	Area once classified as nonattainment but has since demonstrated attainment of the NAAQS.	Area is not in compliance with the NAAQS.

The region is classified as a maintenance area for CO, a nonattainment area for PM<sub>2.5</sub>, and a moderate nonattainment area for O<sub>3</sub>. The area must come into attainment for PM<sub>2.5</sub> and O<sub>3</sub> by April 2010 and June 2010, respectively. EPA has recently (September 21, 2006) revoked the annual PM<sub>10</sub> standard and revised the PM<sub>2.5</sub> 24-hour standard from 65 to 35 ug/m<sup>3</sup>. Attainment status for this revision will be based on monitored data collected in 2007-2009. Area designations will be issued in 2010. Based upon the new designation, attainment dates for PM<sub>2.5</sub> may be revised by the EPA.

Prince George's and Montgomery Counties are part of the Metropolitan Washington Council of Governments (MWCOG). MWCOG is a regional organization of 20 local governments surrounding the nation's capital, plus members of the Maryland and Virginia legislatures, the U.S. Senate, and the U.S. House of Representatives. Among other responsibilities, MWCOG provides daily reports and forecasts of regional air quality. Through MWCOG, the Metropolitan Washington Air Quality Committee prepares the air quality plan for the Washington, D.C.-Maryland-Virginia metropolitan area as regulated under Section 174 of the CAA. The Transportation Planning Board (TPB), housed within MWCOG, is the organization that brings together key decision makers to coordinate planning and funding for the region's transportation system. TPB members include local officials, representatives of state transportation agencies, the Washington Metropolitan Area Transit Authority, state legislators, and others. The TPB is designated as a Metropolitan Planning Organization and is therefore responsible for meeting federal metropolitan planning requirements for transportation. The TPB is staffed by MWCOG.

The TPB is required to produce two basic documents. The first is the *Financially Constrained Long-Range Transportation Plan*, which includes all regionally significant transportation projects and programs that are planned in the Washington region over the next 25 years. This differs from the second document, the *Transportation Improvement Plan (TIP)*, which lists projects and programs that will be funded in the next six years. In order to receive federal funding, transportation projects must be included in the Financially Constrained Long-Range Transportation Plan and the TIP. The TIP is the basis for the regional mobile source air quality analysis, which uses vehicle miles traveled (VMT) and emissions factors to determine emissions estimates for the entire transportation system. The analysis results, presented under the Transportation Conformity Rule, demonstrate that the plan and the TIP are consistent with the goals of the SIP.

The Purple Line is listed in the Washington Metropolitan Region's Fiscal Year 2007-2012 TIP (approved on October 18, 2006). The Metropolitan Washington Air Quality Committee and TPB develop an *Air Quality Conformity Report*, which contains emissions ceilings (called mobile emissions budgets) to which the transportation plan must conform. The draft analysis of the plan indicates that mobile emissions are within currently required budgets for NO<sub>x</sub> and VOCs for 2010, 2020, and 2030. In addition to NO<sub>x</sub> and VOCs, the plan must track and estimate Particulate Matter (PM<sub>2.5</sub>). SIPs, however, are still in the development phase for eight-hour O<sub>3</sub> and PM<sub>2.5</sub>. In the interim, the one-hour motor vehicle emissions budgets are applicable for transportation conformity purposes. For PM<sub>2.5</sub>, the area must maintain a PM<sub>2.5</sub> budget no greater than the 2002 PM<sub>2.5</sub> budget. An eight-hour O<sub>3</sub> SIP was submitted to EPA in May 2007, and a

PM<sub>2.5</sub> SIP is expected to be submitted to EPA in April 2008, although this may change as a result of the new PM<sub>2.5</sub> standards.

### ***2.1.7. Ambient Air Quality in the Study Area***

#### **Local Meteorology**

The nature of the surrounding atmosphere is an important element in assessing the ambient air quality of an area. The project area/corridor/region is located east of the Blue Ridge, Bull Run, and Catocin Mountains. The terrain in the project area/corridor/region is mostly low rolling hills. Easterly winds cause an upslope effect from the Atlantic Ocean, located approximately 120 miles to the east, and the Chesapeake Bay, located approximately 35 miles to the east.

The project area/corridor/region is in the middle latitudes, where the general atmospheric flow is from west to east and favors a continental climate with four well-defined seasons. Summers are warm and at times humid. Winters are mild. Generally pleasant weather prevails in spring and autumn. The coldest period, when low temperatures average 21 degrees, occurs in late January. The warmest period, averaging high of 88 degrees, occurs in the last half of July. Precipitation is rather evenly distributed throughout the year. Annual precipitation has ranged from about 25 inches to more than 55 inches. Rainfalls exceeding 10 inches in a 24-hour period have been recorded during the passage of tropical storms. The seasonal snowfall is nearly 24 inches, but varies greatly from season to season. Snowfalls of four inches or more occur only twice each winter on average. Accumulations of over 20 inches from a single storm are extremely rare. Storm damage results mainly from heavy snows and freezing rains in winter and from hurricanes and severe thunderstorms during other seasons. Precipitation helps cleanse the atmosphere of pollutants. Very small particles in the atmosphere act as condensation nuclei, triggering the formation of raindrops, while larger particles are literally washed from the air during precipitation events. Precipitation also prevents the drying of the ground, alleviating the formation of fugitive dust; however, precipitation can combine with the oxides of sulfur and nitrogen to produce another form of pollution, namely acid rain.

Prevailing winds are from the south, except during the winter when they are from the northwest. The windiest period is late winter and early spring. Winds are generally less during the night and early morning hours and increase to a high in the afternoon. Winds may reach 50 to 60 miles per hour or even higher during severe summer thunderstorms, hurricanes, and winter storms. Wind speed direction and its variability have a large influence on the dispersion of atmospheric pollutants (National Oceanic and Atmospheric Administration 2005).

#### **Monitored Air Quality**

The Air and Radiation Management Administration, within the Maryland Department of the Environment, is responsible for implementing and enforcing regulations to ensure that the air Maryland citizens breathe is clean and healthful. This mission is accomplished through several methods, including air pollution monitoring. The MWCOG collects and distributes air quality data from monitors located throughout the Washington, D.C., Virginia, and Maryland areas. Figure 2-5 shows the location of the monitors within the metropolitan area relative to the project study area.

Monitored air quality data within or near the study area for the years 2004-2006 is presented in Table 2-3. Maximum measured air pollutant concentrations at these monitors are shown in Figure 2-6. Further monitoring information is located in Appendix A.

## **2.2. Environmental Consequences**

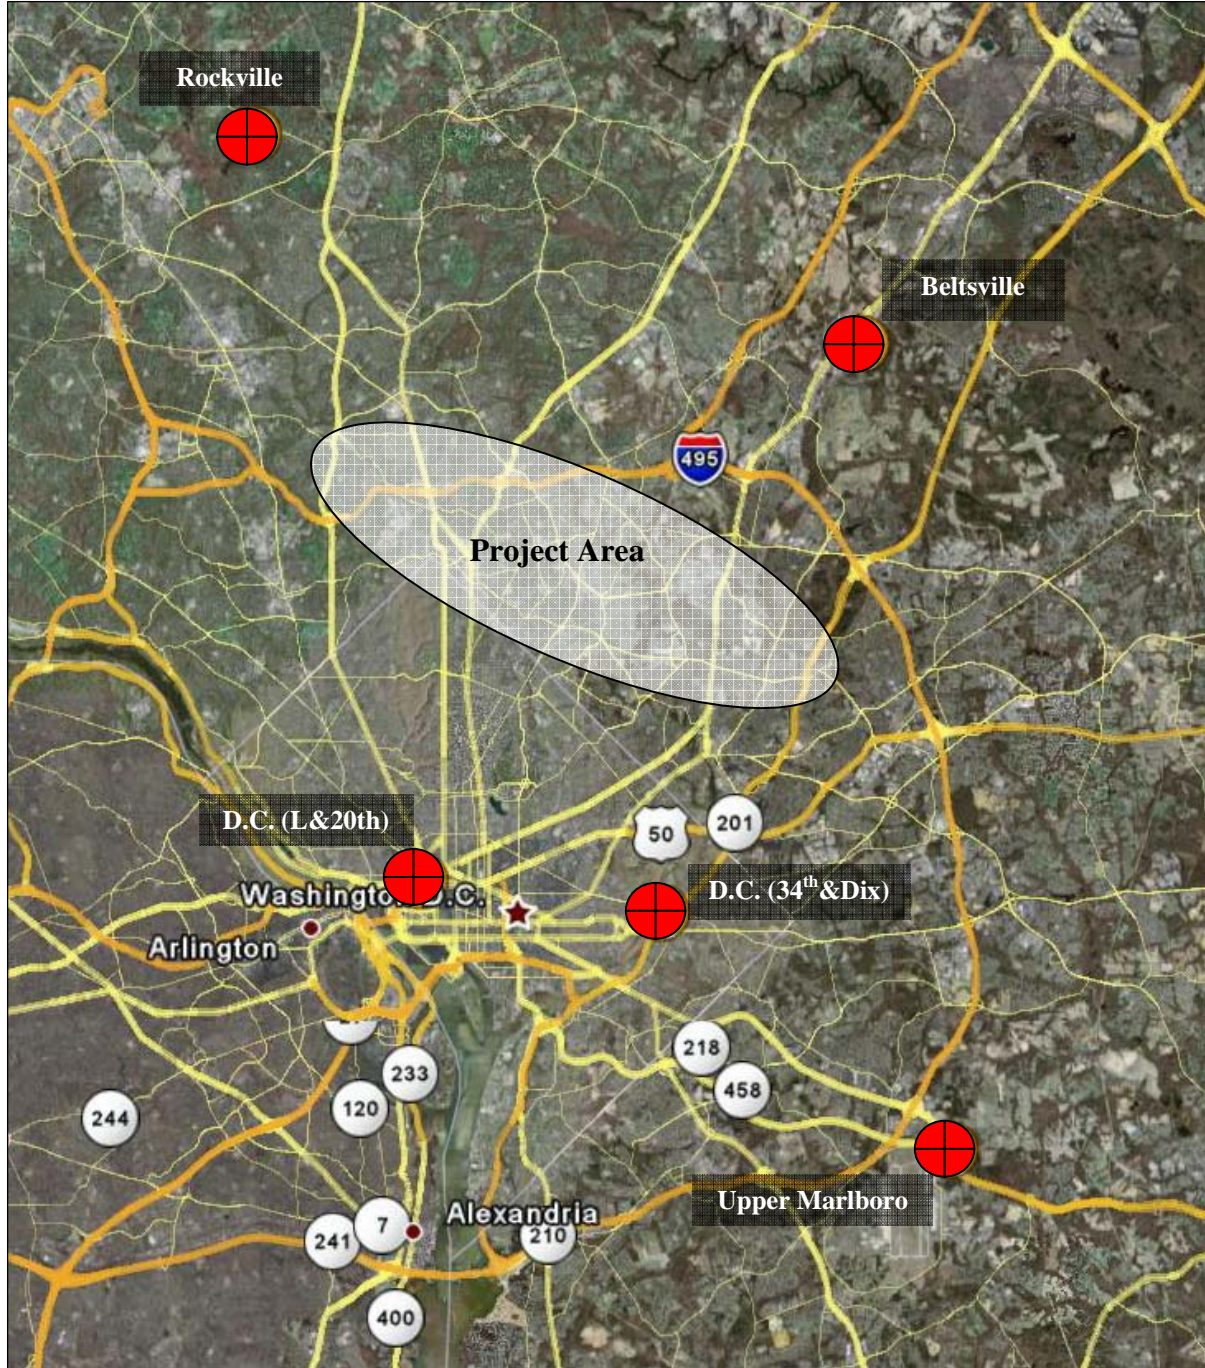

### **2.2.1. Pollutants for Analysis**

Pollutants that can be traced principally to motor vehicles are relevant to the evaluation of the project's impacts; these pollutants include CO, HC, NO<sub>x</sub>, O<sub>3</sub>, PM<sub>10</sub>, PM<sub>2.5</sub>, and MSAT. Transportation sources account for a small percentage of regional emissions of SO<sub>x</sub> and Pb; thus, a detailed analysis is not required.

HC (VOC) and NO<sub>x</sub> emissions from automotive sources are a concern primarily because they are precursors in the formation of ozone and particulate matter. Ozone is formed through a series of reactions that occur in the atmosphere in the presence of sunlight. Since the reactions are slow and occur as the pollutants are diffusing downwind, elevated ozone levels often are found many miles from the sources of the precursor pollutants. Therefore, the effects of HC and NO<sub>x</sub> emissions generally are examined on a regional or mesoscale basis.

PM<sub>10</sub> and PM<sub>2.5</sub> impacts are both regional and local. A significant portion of particulate matter, especially PM<sub>10</sub>, comes from disturbed vacant land, construction activity, and paved road dust. PM<sub>2.5</sub> also comes from these sources. Motor vehicle exhaust, particularly from diesel vehicles, is also a source of PM<sub>10</sub> and PM<sub>2.5</sub>. PM<sub>10</sub>, and especially PM<sub>2.5</sub>, can also be created by secondary formation from precursor elements such as sulfur dioxide (SO<sub>2</sub>), nitrogen oxides (NO<sub>x</sub>), volatile organic compounds (VOCs), and ammonia (NH<sub>3</sub>). Secondary formation occurs due to chemical reaction in the atmosphere generally downwind some distance from the original emission source. Thus, it is appropriate to predict concentrations of PM<sub>10</sub> and PM<sub>2.5</sub> on both a regional and a localized basis.

CO impacts are generally localized. Even under the worst meteorological conditions and most congested traffic conditions, high concentrations are limited to a relatively short distance (300 to 600 feet) of heavily traveled roadways. Vehicle emissions are the major sources of CO. The Purple Line project could change traffic patterns within the project area/corridor/region. Consequently, it is appropriate to predict concentrations of CO on both a regional and a localized or microscale basis.

**Figure 2-6: Maximum Measured Pollutant Concentrations**

MSAT impacts are both regional and local. Through the issuance of EPA's Final Rule, Control of Emissions of Hazardous Air Pollutants from Mobile Sources (66 FR 17229), it was determined that many existing and newly promulgated mobile source emission control programs would result in a reduction of MSATs. Federal Highway Administration (FHWA) projects that even with a 64 percent increase in VMT, on-highway emissions of benzene, formaldehyde, 1,3-butadiene, and acetaldehyde will decrease by 57 percent to 65 percent and on-highway diesel PM emissions will decrease by 87 percent. As a result EPA has concluded that no further motor vehicle emission standards or fuel standards were necessary to further control MSATs.

### **2.2.2. Regional Analysis**

A regional or mesoscale analysis of a project determines a project's overall impact on regional air quality levels. This analysis uses regional VMT and vehicle hours traveled within the region with and without the project to determine daily pollutant burden levels.

### **2.2.3. Microscale CO Analysis**

Microscale air quality modeling was performed using the most recent version of the EPA mobile source emission factor model (MOBILE6.2) and the CAL3QHC (Version 2.0) air quality dispersion model to estimate future No Build (without the proposed project) and future Build (with the proposed project) CO levels at selected locations in the project area/corridor/region.

#### **Dispersion Model**

Mobile source models are the basic analytical tools used to estimate CO concentrations expected under given traffic, roadway geometry, and meteorological conditions. The mathematical expressions and formulations that comprise the various models attempt to describe an extremely complex physical phenomenon as closely as possible. The dispersion modeling program used in this project for estimating pollutant concentrations near roadway intersections is the CAL3QHC (Version 2.0) dispersion model developed by the EPA and released in 1992.

CAL3QHC is a Gaussian model recommended in the *EPA Guidelines for Modeling Carbon Monoxide from Roadway Intersections* (EPA-454/R-92-005). Gaussian models assume that the dispersion of pollutants downwind of a pollution source follows a normal distribution from the center of the pollution source.

Different emission rates occur when vehicles are stopped (idling), accelerating, decelerating, and moving at different average speeds. CAL3QHC simplifies these different emission rates into two components:

- Emissions when vehicles are stopped (idling) during the red phase of a signalized intersection
- Emissions when vehicles are in motion during the green phase of a signalized intersection

The CAL3QHC (Version 2.0) air quality dispersion model has undergone extensive testing by the EPA and has been found to provide reliable estimates of inert (nonreactive) pollutant concentrations resulting from motor vehicle emissions. A complete description of the model is

provided in the *User's Guide to CAL3QHC (Version 2.0): A Modeling Methodology for Predicting Pollutant Concentrations Near Roadway Intersections* (EPA-454/R-92-006).

### **Vehicular Emissions**

Vehicular emissions were estimated using the EPA MOBILE6.2 vehicular emission factor model. (*User's Guide to MOBILE6.2, Mobile Source Emission Factor Model*, Ann Arbor, Michigan, EPA420-R-02-028, October 2002). Input parameters were provided by MWCOG.

MOBILE6.2 is a mobile source emission estimate program that provides current and future estimates of emissions from highway motor vehicles. The latest in the MOBILE series, dating to 1978, MOBILE6.2, was designed by EPA to address a wide variety of air pollution modeling needs. This latest version of MOBILE differs significantly in both structure and data requirements from previous versions. MOBILE6.2 incorporates updated information on basic emission rates, more realistic driving patterns, separation of start and running emissions, improved correction factors, and changing fleet composition. It also includes impacts of new regulations promulgated since the model's previous version, MOBILE5b, was released. Input and output files for the Mobile6.2 program are included in Appendix B.

### **Site Selection and Receptor Locations**

A screening evaluation was performed to identify which intersections in the project area/corridor/region are most congested and most affected by the Build Alternatives. Fifty-eight locations were screened based on changes in intersection volumes, delay, and levels of service (LOS) from the No Build to the Build Alternatives. Sites fail the screening evaluation if the LOS decreases below D in one of the Build Alternatives as compared to the No Build Alternative, or if the delay and/or volume increase from the No Build to Build scenario along with a LOS below D.

Twenty of the 67 locations failed the screening analysis. Of these, 17 intersections were selected for detailed analysis. In addition, three free-flow sites were chosen for analysis (Table 2-4 and Figure 2-7).

For free-flow sites, the following locations were chosen based on nearby land use:

- Georgetown Branch Interim Trail right-of-way – west of MD 410 to Edgevale Court (FF1 on Figure 2-7)
- North Chevy Chase Elementary School – on Jones Bridge Road at Manor Road (FF2 on Figure 2-7)
- Rosemary Hills Elementary School – near Grace Church Road and Lanier Drive (FF3 on Figure 2-7)

Air Quality Technical Report • Page 2-19

15	Veterans Parkway at Annapolis Road	New Carrollton
16	Campus Drive and US 1	College Park
17	East Campus Entrance and US 1	College Park

### **Meteorological Conditions**

The transport and concentration of pollutants emitted from motor vehicles are influenced by three principal meteorological factors: wind direction, wind speed, and the atmosphere's profile. The values for these parameters were chosen to maximize pollutant concentrations at each prediction site (that is, to establish a conservative, worst-case situation).

- **Wind Direction.** Maximum CO concentrations normally are found when the wind is assumed to blow parallel to a roadway adjacent to the receptor location. At complex intersections, it is difficult to predict which wind angle will result in maximum concentrations. Therefore, the approximate wind angle that would result in maximum pollutant concentrations at each receptor location was used in the analysis. All wind angles from 0° to 360° (in 5° increments) were considered.
- **Wind Speed.** CO concentrations are greatest at low wind speeds. A conservative wind speed of one meter per second (2.2 miles per hour) was used to predict CO concentrations during peak traffic periods.

**Temperature and Profile of the Atmosphere.** A minimum temperature of 33° F, a maximum temperature of 53° F, a mixing height (the height in the atmosphere to which pollutants rise) of 1,000 meters, and neutral atmospheric stability (stability class D) conditions were used in estimating microscale CO concentrations. The selection of these meteorological parameters was

based on recommendations from the MWCOG. The CO levels estimated by the model are the maximum concentrations that could be expected to occur at each air quality receptor site analyzed given the assumed simultaneous occurrence of a number of worst-case conditions: peak-hour traffic conditions, conservative vehicular operating conditions, low wind speed, low atmospheric temperature, neutral atmospheric conditions, and maximizing wind direction.

### **Persistence Factor**

Peak eight-hour concentrations of CO were obtained by multiplying the highest peak hour CO estimates by a persistence factor. The persistence factor accounts for the following:

- Over eight-hours (as distinct from a single hour) vehicle volumes will fluctuate downward from the peak hour
- Vehicle speeds may vary
- Meteorological conditions, including wind speed and wind direction, will vary compared to the conservative assumptions used for the single hour

A persistence factor of 0.7 was used in this analysis. This factor is recommended by MWCOG and approved by EPA.

### **Background Concentrations**

Microscale modeling is used to predict CO concentrations resulting from emissions from motor vehicles using roadways immediately adjacent to the locations at which predictions are being made. A CO background level must be added to this value to account for CO entering the area from other sources upwind of the receptors. The CO background level should be located away from the influence of local traffic congestion.

Based on the recommendation of the Maryland State Highway Administration (SHA), a one-hour background level of 4.4 ppm and an eight-hour background level of 2.9 ppm were added to each analysis site.

### **Traffic Information**

Traffic data for the air quality analysis were derived from traffic counts and other information developed as part of an overall traffic analysis for the project using methodology accepted by the SHA. Output from the Synchro6 signal timing traffic model was used to obtain signal timing parameters. The microscale CO analysis was performed based on data from this analysis for the AM and PM peak traffic periods. These are the periods when maximum traffic volumes occur on local streets and when the greatest traffic and air quality effects of the proposed project are expected.

The percentages of each type of vehicle, for the existing and future year conditions, were determined using data for the Metropolitan Washington area provided by MWCOG. Vehicle speeds used in the analysis were obtained from traffic information developed for this project.

## Analysis Years

CO concentrations were predicted for the existing (2006), opening (2015), and design (2030) years for the project.

### 2.2.4. Project Level Emission Burden Assessment

The emission burden analysis of a project determines a project's overall impact on regional air quality levels. As shown in Table 2-5, an emission burden analysis based on the study area's 2030 VMT and vehicle hours traveled was conducted for each of the Build Alternatives and compared to the No Build Alternative. Emission factors were calculated using EPA's MOBILE6 mobile source emission factor program.

**Table 2-5: Project Level Emission Burden Assessment**

Alt	VMT	Pollutant (Kilograms per Day)					Percent Change from No Build				
		CO	NO <sub>x</sub>	VOC	PM <sub>10</sub>	PM <sub>2.5</sub>	CO	NO <sub>x</sub>	VOC	PM <sub>10</sub>	PM <sub>2.5</sub>
No Build	261,054,000	723,722	41,769	21,276	7,022	3,237	--	--	--	--	--
TSM	261,117,354	723,935	41,788	21,284	7,024	3,238	0.02%	0.05%	0.04%	0.03%	0.03%

Medium BRT	260,947,213	723,461	41,759	21,269	7,020	3,236	-0.04%	-0.02%	-0.03%	-0.04%	-0.04%
High BRT	260,886,284	723,291	41,748	21,264	7,018	3,235	-0.07%	-0.05%	-0.05%	-0.06%	-0.06%
Low LRT	260,867,000	723,254	41,739	21,261	7,017	3,235	-0.07%	-0.07%	-0.07%	-0.07%	-0.07%
Medium LRT	260,870,000	723,262	41,739	21,261	7,017	3,235	-0.07%	-0.07%	-0.07%	-0.07%	-0.07%
High LRT	260,877,000	723,281	41,740	21,261	7,018	3,235	-0.07%	-0.07%	-0.07%	-0.07%	-0.07%

CO=carbon monoxide; NO<sub>x</sub>=nitrogen oxides; VOC=volatile organic compounds; PM<sub>10</sub>=particulate matter (10 microns); PM<sub>2.5</sub>=fine particulate matter (2.5 microns).

The TSM Alternative is predicted to increase all regional pollution burden levels by 0.02 percent to 0.05 percent as compared to the No Build Alternative.

The Low Investment BRT Alternative is predicted to decrease CO, PM<sub>10</sub>, and PM<sub>2.5</sub> pollutant burden levels by 0.01 percent to 0.02 percent as compared to the No Build Alternative. NO<sub>x</sub> and VOC pollutant burden levels would remain unchanged as compared to the No Build Alternative.

The Medium Investment BRT Alternative is predicted to decrease all regional pollution burden levels by 0.02 percent to 0.04 percent as compared to the No Build Alternative.

The High Investment BRT Alternative is predicted to decrease all regional pollution burden levels by 0.05 percent to 0.07 percent as compared to the No Build Alternative.

The Low, Medium, and High Investment LRT Alternatives are predicted to decrease all regional pollutant burden levels by 0.07 percent as compared to the No Build Alternative.

All the predicted changes in regional pollutant burden levels due to the project are less than 0.08 percent, making them essentially immeasurable. Overall the project's predicted impact on regional pollutant levels range from minor positive to no impact.

#### **2.2.5. Microscale CO Assessment**

Maximum one-hour and eight-hour CO levels were predicted at receptor sites along the proposed project. Maximum 2015 one-hour CO concentrations are shown in Table 2-6. Maximum 2030 one-hour CO concentrations are shown in Table 2-7. Maximum eight-hour CO concentrations for 2015 and 2030 are shown in Table 2-8. MOBILE6 data used in the CO analysis are contained in Appendix B. CAL3QHC (Version 2) input and output information for each site is contained in Appendix C. No violations of the NAAQS are predicted under any alternative.

#### **2.2.6. PM<sub>2.5</sub> Assessment**

Following the guidelines in EPA's *Transportation Conformity Guidance for Qualitative Hot-Spot Analyses in PM<sub>2.5</sub> and PM<sub>10</sub> Nonattainment and Maintenance Areas (March 29, 2006, referred to as PM<sub>10</sub> Guidance)*, a PM<sub>2.5</sub> hot-spot analysis should be conducted according to qualitative guidance only if the project is a project of air quality concern, defined in 40 CFR 93.123(b)(1) as follows:

- i. New or expanded highway projects that have a significant number of or significant increase in diesel vehicles;
- ii. Projects affecting intersections that are at LOS D, E, or F with a significant number of diesel vehicles, or those that will change to LOS D, E, or F because of increased traffic volumes from a significant number of diesel vehicles;
- iii. New bus and rail terminals and transfer points that have a significant number of diesel vehicles congregating at a single location;
- iv. Expanded bus and rail terminals and transfer points that significantly increase the number of diesel vehicles congregating at a single location; and
- v. Projects in or affecting locations, areas, or categories of sites which are identified in the PM<sub>2.5</sub> or PM<sub>10</sub> applicable implementation plan or implementation plan submission, as appropriate, as sites of violation or possible violation.

Electric vehicles are proposed for the LRT Alternatives; thus, these alternatives are not predicted to affect PM<sub>2.5</sub> levels in the study area. Hybrid buses are proposed for the BRT Alternatives. It is currently assumed that these vehicles will be diesel hybrids. Since it has not been firmly established which particular vehicles will be purchased, it was conservatively assumed for this analysis that emission factors from traditional diesel vehicles would be used to estimate pollutant impacts of the BRT Alternatives. This is conservative because the hybrid buses will likely have lower particulate emissions than traditional diesel buses. Based on this, an analysis was conducted to determine if the BRT Alternatives for the project are alternatives of air quality concern.

Examples of projects of air quality concern that would be covered by 40 CFR 93.123(b)(1)(i) and (ii) include the following:

- A project on a new highway or expressway that serves a significant volume of diesel truck traffic, such as facilities with greater than 125,000 annual average daily traffic (AADT) where 8 percent or more of such AADT is diesel truck traffic;
- New exit ramps and other highway facility improvements to connect a highway or expressway to a major freight, bus, or intermodal terminal;
- Expansion of an existing highway or other facility that affects a congested intersection (operated at LOS D, E, or F) that has a significant increase in the number of diesel trucks; and
- Similar highway projects that involve a significant increase in the number of diesel transit buses and/or diesel trucks.

Examples of projects of air quality concern that would be covered by 40 CFR 93.123(b)(1)(iii) and (iv) include the following:

- A major new bus or intermodal terminal that is considered to be a regionally significant project under 40 CFR 93.101; and
- An existing bus or intermodal terminal that has a large vehicle fleet where the number of diesel buses increases by 50 percent or more, as measured by bus arrivals.

The BRT Alternatives do not affect roadways with more than 125,000 AADT and 8 percent trucks. The major roadways affected by the BRT Alternatives (University Boulevard, Wisconsin Avenue, and Piney Branch Road) have AADT well below 125,000 (Source: <http://www.sha.state.md.us/SHAServices/mapsBrochures/maps/OPPE/tvmaps.asp/>).

Based on current operation projections, the BRT Alternatives are assumed to provide up to 20 bus arrivals during a peak commuting hour. These buses will affect the five major bus transfer points within the project area/corridor/region (Bethesda, Silver Spring, Takoma/Langley, College Park, and New Carrollton). All these stations, with the exception of the College Park Station, have more than 50 bus arrivals during the peak hour; thus the BRT Alternatives would not increase the diesel bus arrivals by 50 percent or more at these stations. At the College Park Station, there are currently approximately 38 bus arrivals. Assuming there is no future growth in

the number of bus arrivals at this station, the BRT Alternative would increase bus arrivals by 50 percent at this location. Following the guidance set forth in 40 CFR 93.123(b)(1)(iv), the project is a project of air quality concern; thus, a qualitative analysis must be conducted.

### **Year of Peak Emission Burden**

As clarified in the preamble to the July 1, 2004, revision to the transportation conformity rule (64 FR 40056), the conformity rule requires that project-level analyses consider the year of expected peak emissions from the project. For PM<sub>2.5</sub>, this is expected to be a near-term year, such as the first year of operation of the project, because emission rates from diesel vehicles are predicted to substantially decline between the opening year (2015) and the design year (2030) and these decreases would more than offset any increase in projected traffic volumes. The decline in emissions in future years are due in part to improvements in tailpipe emissions, national vehicle emissions control programs, and the mandated use of ultra-low sulfur diesel fuel. As shown in the regional PM<sub>2.5</sub> emissions are much higher in current years than in future years. Since regional emissions are a good indicator of the overall emissions trends in the region, it is therefore expected that 2015 would be the year of peak emissions from the project and other emissions sources that affect the project area/corridor/region.

### **Representative Monitor**

The Beltsville monitor, also known as the Muirkirk monitor, is the closest monitor to the project area/corridor/region. It also has the highest AADT and truck percentages of all the monitors near the study area. The Beltsville monitor, therefore, is used as the worst-case representative monitor for the study area.

### **Monitored PM<sub>2.5</sub> Levels**

Table 2-9 highlights the latest three full years (2004 through 2006) of monitored values at the Beltsville monitor. The values are below the applicable annual NAAQS of 15 µg/m<sup>3</sup>. The values were below the former 24-hour standard of 65µg/m<sup>3</sup> in the years it was applicable. In December 2006, the new 24-hour standard of 35 µg/m<sup>3</sup> became effective but not yet enforceable. Based on the current 2006 information available, it appears that the monitored values at this monitor are below this new NAAQS.

**Table 2-9: PM<sub>2.5</sub> Monitored Data**

Time Period	NAAQS	Year		
		2004	2005	2006
Maximum 24-Hour	65 µg/m <sup>3</sup>	38	38	36
Mean Annual	15 µg/m <sup>3</sup>	12.6	13.4	11.5

Based on these data, the highest 98<sup>th</sup> percentile 24-hour monitored value is 38 µg/m<sup>3</sup>, which occurred in 2004 and 2005. This is 58 percent of the still currently applicable standard of 65 µg/m<sup>3</sup>.

### Future Scenario

As shown in Figure 2-8, direct PM<sub>2.5</sub> emissions are expected to substantially decrease in future years for the entire nonattainment area. This predicted decrease in emissions is due in large part to EPA’s Heavy-duty Engine and Vehicle Standards and Highway Diesel Fuel Sulfur Control Requirements – Final Rule, signed in December 2000. According to this rule, particulate matter emission levels are expected to be 90 percent lower on a per vehicle basis in 2030 than they were in 2000.

**Figure 2-8 PM<sub>2.5</sub> Emission Trends**

### Results

Based on the year of expected peak emissions, it was determined that the project opening year, 2015, represents the year for the potential worst-case impacts of the project.

Based on the site characteristics of the nearby PM<sub>2.5</sub> monitoring stations located in the metropolitan area, it was determined that the Beltsville monitor is the closest monitor to the study area. It is also the worst-case monitor because of its high traffic volumes and diesel truck percentages.

Values collected at this monitor from 2004 through 2006 do not violate the current applicable PM<sub>2.5</sub> NAAQS (annual or 24-hour). The 2015 project bus impacts on a per vehicle basis should be less than currently observed at the monitors, based on the implementation of national diesel engine and diesel sulfur fuel regulations that are expected to cut heavy-duty diesel emissions. Also it is proposed that hybrid buses will be used for this project. The hybrid buses are assumed to have lower PM<sub>2.5</sub> emissions than the traditional diesel buses conservatively being assumed in this analysis. In addition, control programs for other sources of PM<sub>2.5</sub> in the region, geared toward meeting the current 2010 attainment date for the PM<sub>2.5</sub> standard, are likely to improve air

quality in the project area/corridor/region. Also, as shown in Table 2-10, the project is predicted to lower overall VMT within the study area.

**Table 2-10: Regional VMT Comparison**

Alternative	VMT per Day	Percent Change from No Build
No Build	261,054,000	--
TSM	261,117,166	0.02%
Low Investment BRT	261,009,967	-0.02%
Medium Investment BRT	260,947,213	-0.04%
High Investment BRT	260,886,887	-0.06%
Low Investment LRT	260,867,000	-0.07%
Medium Investment LRT	260,870,000	-0.07%
High Investment LRT	260,877,000	-0.07%

Based on the analysis provided, it is determined that the project meets all the project-level PM<sub>2.5</sub> conformity requirements, and that the project will not cause or contribute to a new violation of the PM<sub>2.5</sub> NAAQS, or increase the frequency or severity of a violation for the following reasons:

- A monitor with comparable traffic characteristics and roadway influences to the project area/corridor/region in the year of estimated peak emissions is currently monitoring PM<sub>2.5</sub> concentrations that are below the annual and 24-hour standards.
- Vehicular emissions are expected to be reduced in the project area/corridor/region, as demonstrated by projected reductions in regional emissions, as well as by national projections by EPA reflecting the impacts of national emissions-control programs, such as the 2007 Heavy-Duty Diesel Rule.
- The project proposes to use hybrid buses, which are predicted to have lower PM<sub>2.5</sub> emission levels than current diesel buses.
- The project is predicted to reduce regional VMT levels as compared to the No Build Alternative.

#### **2.2.7. MSAT Assessment**

Electric vehicles are proposed for the LRT Alternatives; thus, these alternatives are not predicted to affect MSAT levels in the study area. Hybrid buses are proposed for the BRT Alternatives. It is currently assumed that these vehicles will be diesel hybrids. Since it has not been firmly established which particular vehicles will be purchased, it was conservatively assumed for this analysis that emission factors from traditional diesel buses will be used to estimate pollutant impacts of the BRT Alternatives. This is conservative because the proposed hybrid buses will likely have lower MSAT emissions than traditional diesel buses.

Technical shortcomings of emissions and dispersion models and uncertain science with respect to health effects prevent meaningful or reliable estimates of MSAT emissions and effects of this

project. However, even though reliable methods do not exist to accurately estimate the health impacts of MSATs at the project level, it is possible to qualitatively assess the levels of future MSAT emissions under the project. Although a qualitative analysis cannot identify and measure health impacts from MSATs, it can give a basis for identifying and comparing the potential differences in MSAT emissions, if any, from the alternatives. The qualitative assessment presented below is derived in part from a study conducted by the FHWA titled *A Methodology for Evaluating Mobile Source Air Toxic Emissions among Transportation Project Alternatives*, found at: [www.fhwa.dot.gov/environment/airtoxic/msatcompare/msatemissions.htm](http://www.fhwa.dot.gov/environment/airtoxic/msatcompare/msatemissions.htm).

Based on the recommended tiering approach detailed in the FHWA methodology, the project falls within the Tier 2 approach. The amount of MSATs emitted would be proportional to the VMT, assuming the vehicle mix does not change. As shown in Table 2-10, predicted regional VMT estimates indicate that all Build Alternatives would reduce regional VMT within the 0.02 percent to 0.04 percent range. The additional bus VMT portion of the overall regional VMT, under the BRT and TSM Alternatives, is less than 0.01 percent. These small changes cannot be considered measurable; thus the project is predicted to generally produce no meaningful regional MSAT effects.

The reconfigured travel lanes contemplated as part of the project alternatives may have the effect of moving some traffic closer to nearby homes, schools, and businesses; therefore, there may be localized areas where ambient concentrations of MSATs could be higher under the Build Alternatives than under the No Build Alternative. However, the magnitude and duration of these potential increases compared to the No Build Alternative cannot be accurately quantified because of the inherent deficiencies of current models. In sum, when new travel lanes are constructed, the localized level of MSAT emissions for the Build Alternatives, particularly the BRT Alternatives, could be higher relative to the No Build Alternative, but this could be offset due to increases in localized speeds and reductions in congestion (which are associated with lower MSAT emissions). Also, MSATs would be lower in other locations when traffic shifts away from them. However, on a regional basis, EPA's vehicle and fuel regulations coupled with fleet turnover will cause region-wide MSAT levels to be significantly lower than today in almost all cases.

Sensitive receptors include those facilities most likely to contain large concentrations of the more sensitive population. These include hospitals, schools, licensed day cares, and elder care facilities. Dispersion studies have shown that the roadway air toxics start to drop off at about 100 meters (328 feet). By 500 meters (1,640 feet), most studies have found it very difficult to distinguish the roadway from background toxic concentrations in any given area.

This air quality report includes a basic analysis of the likely MSAT emission impacts of this project. However, available technical tools do not enable us to predict project-specific health impacts of the emission changes associated with the project alternatives. As a result of these limitations, the following discussion is included in accordance with the Council on Environmental Quality's regulations (40 CFR 1502.22(b)) regarding incomplete or unavailable information.

### **Information that is Unavailable or Incomplete**

Evaluating the environmental and health impacts from MSATs on a proposed transportation project would involve several key elements, including emissions modeling, dispersion modeling to estimate ambient concentrations resulting from the estimated emissions, exposure modeling to estimate human exposure to the estimated concentrations, and then a final determination of health impacts based on the estimated exposure. Each of these steps is encumbered by technical shortcomings or uncertain science that prevents a more complete determination of the MSAT health impacts of this project.

- **Emissions:** The EPA tools to estimate MSAT emissions from motor vehicles are not sensitive to key variables determining emissions of MSATs in the context of transportation projects. While MOBILE6.2 is used to predict emissions at a regional level, it has limited applicability at the project level. MOBILE6.2 is a trip-based model—emission factors are projected based on a typical trip of 7.5 miles and on average speeds for this typical trip. This means that MOBILE6.2 does not have the ability to predict emission factors for a specific vehicle-operating condition at a specific location at a specific time. Because of this limitation, MOBILE6.2 can only approximate the operating speeds and levels of congestion likely to be present on the largest-scale projects and cannot adequately capture emissions effects of smaller projects. For particulate matter, the model results are not sensitive to average trip speed, although the other MSAT emission rates do change with changes in trip speed. Also, the emissions rates used in MOBILE6.2 for both particulate matter and MSATs are based on a limited number of tests of mostly older-technology vehicles. Lastly, in its discussions of PM under the conformity rule, EPA has identified problems with MOBILE6.2 as an obstacle to quantitative analysis. These deficiencies compromise the capability of MOBILE6.2 to estimate MSAT emissions. MOBILE6.2 is an adequate tool for projecting emissions trends, and performing relative analyses between alternatives for very large projects, but it is not sensitive enough to capture the effects of travel changes tied to smaller projects or to predict emissions near specific roadside locations.
- **Dispersion.** The tools to predict how MSATs disperse are also limited. The EPA's current regulatory models, CALINE3 and CAL3QHC, were developed and validated more than a decade ago for the purpose of predicting episodic concentrations of carbon monoxide to determine compliance with the NAAQS. The performance of dispersion models is more accurate for predicting maximum concentrations that can occur at some time at some location within a geographic area. This limitation makes it difficult to predict accurate exposure patterns at specific times at specific highway project locations across an urban area to assess potential health risk. The National Cooperative Highway Research Program recently finished research on best practices in applying models and other technical methods in the analysis of MSATs. This work focuses on identifying appropriate methods of documenting and communicating MSAT impacts in the NEPA process and to the general public. Analysis recommendations based on this research have not yet been issued by EPA. Along with these general limitations of dispersion models, FHWA is also faced with a lack of monitoring data in most areas for use in establishing project-specific MSAT background concentrations.

- **Exposure Levels and Health Effects.** Finally, even if emission levels and concentrations of MSATs could be accurately predicted, shortcomings in current techniques for exposure assessment and risk analysis preclude us from reaching meaningful conclusions about project-specific health impacts. Exposure assessments are difficult because it is difficult to accurately calculate annual concentrations of MSATs near roadways and to determine the portion of a year that people are actually exposed to those concentrations at a specific location. These difficulties are magnified for 70-year cancer assessments, particularly because unsupportable assumptions would have to be made regarding changes in travel patterns and vehicle technology (which affects emissions rates) over a 70-year period. Considerable uncertainties are also associated with the existing estimates of toxicity of the various MSATs because of factors such as low-dose extrapolation and translation of occupational exposure data to the general population. Because of these shortcomings, any calculated difference in health impacts among the alternatives is likely to be much smaller than the uncertainties associated with calculating the impacts. Consequently, the results of such assessments would not be useful to decision makers, who would need to weigh this information against other project impacts that are better suited for quantitative analysis.

### **Summary of Existing Credible Scientific Evidence Relevant to Evaluating the Impacts of MSATs**

Research on the health effects of MSATs is ongoing. For different emission types, a variety of studies show that some emissions either are statistically associated with adverse health outcomes through epidemiological studies (frequently based on emissions levels found in occupational settings) or that animals demonstrate adverse health outcomes when exposed to large doses.

Exposure to toxics has been a focus of a number of EPA efforts. Most notably, the agency conducted the National Air Toxics Assessment in 1996 to evaluate modeled estimates of human exposure applicable to the county level. While not intended for use as a measure of, or benchmark for, local exposure, the modeled estimates in the National Air Toxics Assessment database best illustrate the levels of various toxics when aggregated to a national or state level.

The EPA is in the process of assessing the risks of various kinds of exposures to these pollutants. The EPA Integrated Risk Information System is a database of human health effects that may result from exposure to various substances found in the environment. The Integrated Risk Information System database is located at <http://www.epa.gov/iris>.

There have been other studies that address MSAT health impacts in proximity to roadways. The Health Effects Institute, a non-profit organization funded by EPA, FHWA, and industry, has undertaken a major series of studies to research near-roadway MSAT hot spots, the health implications of the entire mix of mobile source pollutants, and other topics. The final summary of the series is not expected for several years.

Some recent studies have reported that proximity to roadways is related to adverse health outcomes – particularly respiratory problems<sup>1</sup>. Much of this research is not specific to MSATs, instead surveying the full spectrum of both criteria and other pollutants. The FHWA cannot evaluate the validity of these studies, but more importantly, the studies do not provide information that would be useful to alleviate the uncertainties listed above and enable us to perform a more comprehensive evaluation of the health impacts specific to this project.

### **Relevance of Unavailable or Incomplete Information**

Because of the uncertainties outlined above, a quantitative assessment of the effects of air toxic emissions impacts on human health cannot be made at the project level. While available tools do allow us to reasonably predict relative emissions changes among alternatives for larger projects, the amount of MSAT emissions from each of the project alternatives and MSAT concentrations or exposures created by each of the project alternatives cannot be predicted with enough accuracy to be useful in estimating health impacts. (The current emissions model is not capable of serving as a meaningful emissions analysis tool for smaller projects). Therefore, the relevance of the unavailable or incomplete information is that it is not possible to make a determination of whether any of the alternatives would have significant adverse impacts on the human environment.

Emissions would likely be lower than present levels in the design year as a result of EPA's national control programs that are projected to reduce MSAT emissions by 57 to 87 percent between 2000 and 2020 (Figure 2-9). Local conditions may differ from these national projections in terms of fleet mix and turnover, VMT growth rates, and local control measures. However, the magnitude of the EPA-projected reductions is so great (even after accounting for VMT growth) that MSAT emissions in the study area are likely to be lower in the future in nearly all cases.

This document has provided a qualitative analysis of MSAT emissions relative to the various alternatives and has acknowledged that the Build Alternatives may increase exposure to MSAT emissions in certain locations, although the concentrations and duration of exposures are uncertain. Because of this uncertainty, the health effects from these emissions cannot be estimated.

**Figure 2-9: Projected MSAT Emissions and Traffic Volumes – 2000 - 2020**

### 2.2.8. Greenhouse Gas Assessment

CO<sub>2</sub> emission estimates are based on the amount of direct energy required for each alternative. The direct energy values represent the energy required for vehicle propulsion. This energy is a function of traffic characteristics such as volume, speed, distance traveled, vehicle mix, and thermal value of the fuel being used. The direct energy calculations also include the energy required to fuel the BRT Alternatives and power the LRT Alternatives. CO<sub>2</sub> emission coefficient factors are then applied to the energy estimates to determine the amount of CO<sub>2</sub> generated. For roadway energy a CO<sub>2</sub> emission coefficient of 156.425 lbs CO<sub>2</sub> per million BTU and 161.386 per million BTU were used for gasoline fueled vehicles and diesel fueled vehicles, respectively. A coefficient factor of 401.5 lbs CO<sub>2</sub> per million BTU was used for electrical power generation for the LRT. All coefficient factors were obtained from the Department of Energy, Energy Information Administration.

As shown in Table 2-11, CO<sub>2</sub> emission burdens under the Build Alternatives are predicted to demonstrate almost no change (less than 0.1 percent) as compared to the No Build Alternative. The BRT Alternatives are predicted to produce slightly lower CO<sub>2</sub> emission burdens as compared to the No Build Alternative and the LRT Alternatives are predicted to produce slightly higher CO<sub>2</sub> emission burdens. Considering the scale of these numbers and the very small predicted percent changes, difference in the predicted CO<sub>2</sub> emission burdens for the alternatives can be considered insignificant and are not measurably different from the No Build Alternative.

**Table 2-11: CO<sub>2</sub> Emission Burdens**

Alternative	Daily Direct Energy (million BTUs)	Total CO <sub>2</sub> (kg)	Percent Change from No Build
No Build	1,489,183	105,662,258	-
TSM	1,489,816	105,707,906	0.04%
Low Investment BRT	1,489,200	105,664,193	0.00%
Medium Investment BRT	1,488,840	105,638,656	-0.02%
High Investment BRT	1,488,495	105,614,187	-0.05%
Low Investment LRT	1,488,741	105,700,348	0.04%
Medium Investment LRT	1,488,751	105,700,348	0.04%
High Investment LRT	1,488,825	105,709,291	0.04%

## 2.3. Construction Impacts on Air Quality

In general, construction-related effects of the project would be limited to short-term increased fugitive dust and mobile-source emissions during construction. State and local regulations regarding dust control and other air quality emission reduction controls should be followed.

Once a preferred alternative is selected, a quantitative construction analysis should be conducted if it is determined that construction will go beyond five years at one location. This will help to ensure that the project does not cause or exacerbate a violation of the NAAQS, particularly the PM<sub>2.5</sub> and PM<sub>10</sub> standards, during construction.

### **2.3.1. Fugitive Dust Emissions**

Fugitive dust is airborne particulate matter, generally of a relatively large particulate size. Construction-related fugitive dust would be generated by haul trucks, concrete trucks, delivery trucks, and earth-moving vehicles operating around the construction sites. This fugitive dust would be caused by particulate matter that is re-suspended (kicked up) by vehicle movement over paved and unpaved roads, dirt tracked onto paved surfaces from unpaved areas at access points, and material blown from uncovered haul trucks.

Generally, the distance that particles drift from their source depends on their size, the emission height, and the wind speed. Small particles (30 to 100 micron range) can travel several hundred feet before settling to the ground. Most fugitive dust, however, is comprised of relatively large particles (that is, particles greater than 100 microns in diameter). These particles are responsible for the reduced visibility often associated with this type of construction. Given their relatively large size, these particles tend to settle within 20 to 30 feet of their source.

To minimize the amount of construction dust generated, the guidelines below should be followed. The following prevention and mitigation measures, consistent with the *DDOT Division 100 General Requirements*, should be taken to minimize the potential particulate pollution problem:

#### **Site Preparation**

- Minimize land disturbance
- Use watering trucks to minimize dust
- Cover trucks when hauling dirt
- Stabilize the surface of dirt piles if they are not removed immediately
- Use windbreaks to prevent accidental dust pollution
- Limit vehicular paths and stabilize temporary roads
- Pave all unpaved construction roads and parking areas to road grade for a length no less than 50 feet from where such roads and parking areas exit the construction site to prevent dirt from washing onto paved roadways

#### **Construction**

- Cover trucks when transferring materials
- Use dust suppressants on unpaved traveled paths
- Minimize unnecessary vehicular and machinery activities
- Minimize dirt track-out by washing or cleaning trucks before leaving the construction site. An alternative to this strategy is to pave a few hundred feet of the exit road just before entering the public road.

### **Post-Construction**

- Revegetate any disturbed land not used
- Remove unused material
- Remove dirt piles
- Revegetate all vehicular paths created during construction to avoid future off-road vehicular activities

#### **2.3.2. *Mobile Source Emissions***

Since CO emissions from motor vehicles generally increase with decreasing vehicle speed, disruption of traffic during construction (such as a temporary reduction of roadway capacity and increased queue lengths) could result in short-term, elevated concentrations of CO. To minimize the amount of emissions generated, every effort should be made during construction to limit disruption to traffic, especially during peak travel hours.

### **2.4. Conclusions**

The purpose and need of the project focuses on meeting the current and future regional transportation needs of the area. The project is not predicted to cause or exacerbate a violation of the NAAQS. The project is not expected to measurably increase regional emission burdens or MSAT levels. The project is also not expected to cause a violation of the PM<sub>2.5</sub> standard.

Construction-related effects of the project would be limited to short-term increased fugitive dust and mobile-source emissions during construction. State and local regulations regarding dust control and other air quality emission reduction controls should be followed. Once a preferred alternative is selected, a quantitative construction analysis should be conducted if it is determined that the construction will last longer than five years.

**Disclaimer:** AirData reports are produced from a monthly extract of EPA's air pollution database, AQS. Data for this report were extracted on June 5, 2007. They represent the best information available to EPA from state agencies on that date. However, some values may be absent due to incomplete reporting, and some values subsequently may be changed due to quality assurance activities. The AQS database is updated daily by state and local organizations who own and submit the data. Please contact the pertinent [state agency](#) to report errors.

Readers are cautioned not to infer a qualitative ranking order of geographic areas based on AirData reports. Air pollution levels measured in the vicinity of a particular monitoring site may not be representative of the prevailing air quality of a county or urban area. Pollutants emitted from a particular source may have little impact on the immediate geographic area, and the amount of pollutants emitted does not indicate whether the source is complying with applicable regulations.

However, some values may be absent due to incomplete reporting, and some values subsequently may be changed due to quality assurance activities. The AQS database is updated daily by state and local organizations who own and submit the data. Please contact the pertinent [state agency](#) to report errors.

Readers are cautioned not to infer a qualitative ranking order of geographic areas based on AirData reports. Air pollution levels measured in the vicinity of a particular monitoring site may not be representative of the prevailing air quality of a county or urban area. Pollutants emitted from a particular source may have little impact on the immediate geographic area, and the amount of pollutants emitted does not indicate whether the source is complying with applicable regulations.

## Monitor Values Report - Criteria Air Pollutants

**Geographic Area:** District Of Columbia, Maryland, Virginia

**Pollutant:** Ozone

**Year:** 2004, 2005, 2006

### EPA Air Quality Standards:

Ozone: 0.12 ppm (1-hour average), 0.08 ppm (8-hour average)

ppm = parts per million

132 Rows

**Disclaimer:** AirData reports are produced from a monthly extract of EPA's air pollution database, AQS. Data for this report were extracted on June 5, 2007. They represent the best information available to EPA from state agencies on that date. However, some values may be absent due to incomplete reporting, and some values subsequently may be changed due to quality assurance activities. The AQS database is updated daily by state and local organizations who own and submit the data. Please contact the pertinent [state agency](#) to report errors.

Readers are cautioned not to infer a qualitative ranking order of geographic areas based on AirData reports. Air pollution levels measured in the vicinity of a particular monitoring site may not be representative of the prevailing air quality of a county or urban area. Pollutants emitted from a particular source may have little impact on the immediate geographic area, and the amount of pollutants emitted does not indicate whether the source is complying with applicable regulations.

## Monitor Values Report - Criteria Air Pollutants

**Geographic Area:** District Of Columbia, Maryland, Virginia**Pollutant:** Particulate (size < 10 micrometers)**Year:** 2004, 2005, 2006**EPA Air Quality Standards:**

Particulate (diameter &lt; 10 micrometers): 150 µg/m3 (24-hour average), 50 µg/m3 (annual mean)

µg/m3 = micrograms per cubic meter

71 Rows

**Comma****Tab**[About exporting](#)

**Disclaimer:** AirData reports are produced from a monthly extract of EPA's air pollution database, AQS. Data for this report were extracted on June 5, 2007. They represent the best information available to EPA from state agencies on that date. However, some values may be absent due to incomplete reporting, and some values subsequently may be changed due to quality assurance activities. The AQS database is updated daily by state and local organizations who own and submit the data. Please contact the pertinent [state agency](#) to report errors.

Readers are cautioned not to infer a qualitative ranking order of geographic areas based on AirData reports. Air pollution levels measured in the vicinity of a particular monitoring site may not be representative of the prevailing air quality of a county or urban area. Pollutants emitted from a particular source may have little impact on the immediate geographic area, and the amount of pollutants emitted does not indicate whether the source is complying with applicable regulations.

## Monitor Values Report - Criteria Air Pollutants

**Geographic Area:** District Of Columbia, Maryland, Virginia**Pollutant:** Particulate (size < 2.5 micrometers)**Year:** 2004, 2005, 2006**EPA Air Quality Standards:**

Particulate (diameter &lt; 2.5 micrometers): 65 µg/m3 (24-hour average), 15.0 µg/m3 (annual mean)

µg/m3 = micrograms per cubic meter

127 Rows

[About exporting](#)

**Disclaimer:** AirData reports are produced from a monthly extract of EPA's air pollution database, AQS. Data for this report were extracted on June 5, 2007. They represent the best information available to EPA from state agencies on that date. However, some values may be absent due to incomplete reporting, and some values subsequently may be changed due to quality assurance activities. The AQS database is updated daily by state and local organizations who own and submit the data. Please contact the pertinent [state agency](#) to report errors.

Readers are cautioned not to infer a qualitative ranking order of geographic areas based on AirData reports. Air pollution levels measured in the vicinity of a particular monitoring site may not be representative of the prevailing air quality of a county or urban area. Pollutants emitted from a particular source may have little impact on the immediate geographic area, and the amount of pollutants emitted does not indicate whether the source is complying with applicable regulations.
